

Isokern® STANDARD® Fireplace

with Fire-Lite Application

and DM Chimney System

Installation, Operation, Maintenance and Owner's Manual

STANDARD Models 80S36, 80S42 & 80S46

A PRODUCT OF EARTHCORE INDUSTRIES, LLC.

IMPORTANT: This manual contains assembly rules, installation steps, guidelines, use and maintenance instructions for the STANDARD 80S36, 80S42 & 80S46 fireplaces and the DM chimney system, and Fire-Lite Application with the ECO-STEEL & ECOSTEEL + Chimney System. This manual must become the property of and be reviewed by all current and future users of this product. It is the responsibility of the general contractor and the installer of this product to ensure that the instructions in this manual are followed exactly and that any allowed gas log appliance used in this product be installed in strict accordance with NFPA 58, NFPA 54/ANSI Z223.1 and the gas log manufacturer's explicit installation, sizing, and operation instructions. It is the responsibility of the general contractor to provide adequate clearances from all firebox surfaces as specified in this manual.

INSTALLER: Leave this manual with the fireplace
CONSUMER: Retain this manual for future reference

Be Sure to Read Entire Manual Before Beginning Construction.

Contents of this manual may change without prior notification.

DO NOT install the STANDARD Series Fireplace in a manufactured home or mobile home or recreational vehicle.

General Information

The STANDARD Series fireplace and DM chimney system is a prefabricated, refractory modular fireplace and chimney system designed for field assembly. The system consists of interlocking precast parts which are adhered versus glued together with a masonry adhesive.

The parts of the STANDARD Series fireplace and DM chimney system are precast using a proprietary mixture of volcanic pumice aggregate and cement. It includes all the parts necessary for assembly of a complete firebox, smoke dome and chimney system.

Each STANDARD precast fireplace component is designed for a specific part of the fireplace such that only one means for assembly is possible.

The firebox and smoke dome are designed to be fitted with a traditional cast iron, poker-style throat damper. However, metal flue pipe, electronic or chimney top dampers are options.

The STANDARD Series fireplaces is available in three sizes: 36, 42 & 46.

The STANDARD Series fireplace requires a standard refractory firebrick liner be applied to the interior of the firebox. In the 36, 42 & 46 models the firebrick must be a minimum thickness of 1-1/8" on the side walls, floor and back wall.

All units have a (32") rough opening height before firebrick. The only parts which differ among the available sizes are width related pieces. All units use the same side wall pieces.

The DM chimney system is a dual module refractory chimney system. The basic chimney consists of an outer casing block and an inner liner. It is acceptable to use mechanical assist draft systems, if the venting companies perform the engineering calculations and make the necessary recommendations for fan size and flue vent diameter following the guidelines of NFPA 211/2006, pg. 211-13. Installation of such systems must also follow the mechanical drafting company's explicit installation and operation instructions.

"Smokefree" operation is not warranted nor is the manufacturer responsible for inadequate system draft caused by mechanical systems, general construction conditions, inadequate chimney heights, adverse wind conditions or any unusual environmental conditions or factors beyond the manufacturer's control. The DM chimney components are field assembled using Earthcore Adhesive to glue the components together.

The DM chimney system also includes an offset chimney block component, used to create offsets to the vertical run of the chimney. A brick ledge component is available, designed to support chimney top brick veneer finishes. Prefabricated masonry chimney termination caps are also available.

The STANDARD Series fireplace and DM chimney components will be described and illustrated in the following pages. Close attention should be paid to each component group's specifications and installation requirements as described in this manual.

Recommended minimum overall height for the Isokern fireplace, DM, ECO-STEEL & ECO-STEEL + chimney system for an indoor application is 18'-0" when the chimney is straight and 21'-0" when a chimney is offset.

Maximum DM54 Chimney height without additional support needed: 57' – 0"

Overall DM54 Chimney height, with proper structural support, should not exceed: 82 – 0"

Intended Product Use Statement:

The STANDARD Series fireplace and DM chimney systems are intended to burn solid wood fuel, propane, or natural gas.

NOTE: Installation of a gas pipe must comply with the Standard for Decorative Gas Appliances for Installation in Vented Fireplaces, ANSI Z21.60.

This fireplace is intended for use as a supplemental heat source only and is not intended for heavy use as a primary heating system.

Over-firing, abusive burning or mistreatment will void any claims (e.g., burning construction debris or other highly flammable material, tossing, kicking, or otherwise forcing logs into the firebox).

The STANDARD Series fireplaces and DM chimney systems are conventional indoor or outdoor fireplaces designed to appear like traditional masonry fireplaces. The STANDARD Series fireplace and DM chimney system units are intended for installation in residential homes and other buildings of conventional construction.

NOTE: The local authority having code jurisdiction should be consulted before installation to determine the need to obtain a permit.

General Information

Important areas of concern with the installation of these fireplaces: are construction of proper load bearing foundation and concrete support slab; code required hearth extension substrates and supports; proper assembly of components; clearance to combustible materials; height of chimney; and techniques employed in applying finishing materials to the fireplace opening and hearth extension.

Each of these important topics will be covered in detail throughout this manual. Installation personnel must give special attention to each topic as the installation progresses.

All work performed on, near and adjoining the fireplace and chimney installation must meet or exceed the specifications and requirements in this manual and the prevailing local building code.

Subsequent renovations, additions of cabinets and storage spaces in the enclosure surrounding the fireplace are also limited to the specifications in this manual and to the prevailing local building code.

Isokern is not responsible for other construction work around the fireplace unit.

We recommend (1) 4" outside air kit for Standard 36, 42 & 46. The STANDARD Series fireplace and DM chimney system is tested and listed by Warnock Hersey (Intertek Testing Service) - Report No. 3159656MID-008 & 3082504-T1 to UL 127, and UL 103HT.

STANDARD Series fireplace systems are also designed for installation in accordance with the National Fire Protection Association Standard for chimneys, fireplaces, vents, and Solid Fuel-Burning Appliances (NFPA 211).

IMPORTANT: The top plate of the firebox is not meant to be used as a structural support. Please consult structural engineer for structural support of any veneer bearing weight on the Isokern top plate.

NOTE: Do not scale drawings. Illustrations in this manual are not to scale and are intended to show "typical" installations.

Nominal dimensions are given for design and framing reference only since actual installations may vary due to job specific design preferences. Always maintain the stated minimum clearances to combustible materials. Do not violate any specific installation requirements.

SEISMIC CODE:

If you are installing the STANDARD Series Fireplace in a location where there is seismic code, follow these instructions for installation:

Four No. 4 ASTM A615 Grade 40 minimum, vertical reinforcing bars, 2 on the inside of each sidewall cavity running from approximately 4 inches into the concrete slab (for anchorage) to the top of the side wall cavity and fill with 2000psi minimum concrete or grout. Also see page 55 for more information.

For seismic anchorage design and instructions of the flush hearth application, please contact the Technical Department at 1-800-642-2920.

Safety Instructions

WARNING: This product contains or generates chemicals known to the state of California to cause cancer or birth defects or other reproductive harm.

IMPORTANT: Read this owner's manual carefully and completely before trying to assemble, operate, or service this fireplace. Improper use of this fireplace can cause serious injury or death from fire, burns, explosions and carbon monoxide poisoning.

DANGER: CARBON MONOXIDE POISONING MAY LEAD TO DEATH!

If gas application is used with STANDARD Series fireplace; Propane (LP) gas and natural gas (NG) are both colorless and odorless gases. An odor-making agent is added to each of these gases to help you detect a gas leak. However, the odor added to these gases can fade and gas may be present even though no odor exists.

Carbon Monoxide Poisoning: Early signs of carbon monoxide poisoning resemble flu symptoms, including headaches, dizziness, or nausea. If you have these signs the fireplace may not have been installed properly, get fresh air at once! Have the fireplace inspected and serviced by a qualified service person or your gas supplier. Some people are more affected by carbon monoxide than others. These include pregnant women, people with heart or lung diseases or anemia, people at high altitude or under the influence of alcohol. Earthcore Industries strongly recommends the use of a carbon monoxide detector/alarm device wherever gas fired appliances are in use.

All parties either involved in or associated with the installation, service, and use of this fireplace must read this entire manual. Keep this manual for reference and as a guidebook to safe operation of this fireplace.

1. Always check local building codes governing fireplaces and fireplace installations. The STANDARD Series fireplace and DM chimney installation must comply with all local, regional, state, and national codes and regulations.

2. The STANDARD Series fireplace and DM chimney systems are intended for use in any application where a traditional masonry type fireplace would apply. The chimney system must always vent vertically to the outside of the building.

3. Creosote and soot formation and the need for removal: When wood is burned slowly, it produces tar and other organic vapors which combine with expelled moisture to form creosote. The creosote vapors condense in the relatively cool chimney flue of a slow burning fire. As a result, creosote residue accumulates on the flue lining.

When ignited this creosote makes an extremely hot fire.

Because of creosote and soot buildup it is necessary to inspect and clean the fireplace and chimney prior to use and periodically during the heating season. Cleaning of the fireplace and the chimney system should be done annually at a minimum. In colder climates, chimney cleaning may need to be done periodically throughout the heating season.

4. Before servicing, allow the fireplace to cool. Always shut off any electricity or gas to the fireplace while working on it.

5. Use only solid fuel or Natural Gas or LP Gas log sets in this unit. Do not use artificial wax-based logs, chemical chimney cleaners or flame colorants in this fireplace.

6. For propane (LP) use do not place propane supply tank(s) inside any structure. Locate propane supply tank(s) outdoors. To prevent performance problems, do not use propane fuel tank of less than 100 lbs. capacity.

7. Never use gasoline, kerosene, gasoline-type lantern fuel, charcoal lighter fluid, or similar liquids to start or "freshen up" a fire in this fireplace. Keep all flammable liquids at a safe distance from the fireplace.

8. Always keep the flue damper open when heat is present in the fireplace.

9. Do not use a fireplace insert or any other product not specified for use with the STANDARD Series fireplace and DM chimney systems unless written authorization is given by Earthcore Industries, LLC. Failure to heed this warning may cause a fire hazard and will void the warranty.

10. This fireplace is not intended to heat an entire home or to be used as a primary heat source. It is designed to ensure homeowner comfort by providing supplemental heat to the room.

11. Always ensure that an adequate supply of replacement combustion air from the outside of the house is accessible to the fire to support normal combustion. Fireplaces consume large volumes of air during the normal firing process.

In the event the home is tightly sealed and has modern energy efficient features, the combustion air supply kits may not provide all the air required to support combustion and the proper flow of combustion gases up

Safety Instructions

the chimney.

The manufacturer is not responsible for any smoking or related problems that may result from the lack of adequate air supply flowing into the house. It is the responsibility of the builder/contractor to ensure that adequate air supply has been provided for the fireplace.

CAUTION: When used with the STANDARD Series fireplace system, all gas log sets must be operated with the damper clamped in the fully open position. This includes unlisted "vent free" log sets. Only listed "vent free" log sets may be operated with the damper in the closed position.

12. When in doubt about a component's usability - has visible or suspected physical damage - consult your Isokern distributor or authorized Isokern representative for advice.

13. Modification to STANDARD components not mentioned in this manual may void claims, listings and approvals and could result in an unsafe and potentially dangerous installation.

Alterations to the STANDARD firebox are allowed with prior written approval and instructions from Earthcore Industries, LLC. The installer indemnifies the manufacturer of all claims and under no circumstances will the manufacturer be liable for consequential, incidental, indirect, punitive, or other damages of any kind or nature, whether foreseeable or not, based on any claim by any party as to the modifications of the Isokern fireplaces.

14. Keep all insulation, vapor barriers, "house wrap" paper and other insulating type membranes and products, including fiberglass, cellulose and other insulation, (anything that carries an "R" rating) a minimum of three inches (3") away from all firebox and chimney surfaces.

EXCEPTION: If insulation is used in walls surrounding the fireplace, insulation may be installed behind sheathing of gypsum board, plywood, particle board or other material on the side facing the Isokern. The facing material cannot be within 1 1/2" to the sidewalls and backwalls of the fireplace.

WARNING: Do not pack required air spaces with insulation or other materials.

15. Never leave children unattended when there is a fire burning in the fireplace.

16. Burning some fuels (such as charcoal) can be hazardous due to the possibility of producing carbon monoxide, a colorless, odorless gas. Early signs of carbon monoxide

poisoning resemble flu symptoms, including headaches, dizziness, or nausea. Overexposure to carbon monoxide can lead to illness and death. It is strongly recommended to install smoke and carbon monoxide alarm / detector devices wherever fireplaces are installed.

17. Young children should be carefully supervised when they are in the same room as the appliance. Toddlers, young children, and others may be susceptible to accidental contact burns. A physical barrier is recommended if there are at-risk individuals in the house. To restrict access to the fireplace, install an adjustable safety gate to keep toddlers, young children, and other at-risk individuals out of the room and away from hot surfaces.

18. Clothing or flammable material should not be placed on or near the fireplace.

19. Due to high temperatures, the fireplace should be located out of traffic and away from furniture and draperies.

20. If glass doors are installed with the fireplace Do NOT clean glass front when hot or in use. Wait until Fireplace is OFF and has cooled to room temperature before cleaning glass. Do not use abrasive cleaners on the glass.

21. Do not nail or screw into the Isokern fireplace, which includes firebox, smoke dome and DM Chimney components unless attaching the anchor plate for the metal flue system. This may alter the integrity of the fireplace and cause a house fire. This will VOID the warranty of the fireplace.

22. Never spray or apply any type of sealer, insulation, or other materials to the fireplace.

Isokern Fireplace and Chimney Systems are tested and listed to UL standards: UL 127, ULC S610, and UL 103HT. The listing label shown in Figure 1 above outlines the listed clearances to combustibles and indicates that the units are suitable for use with solid fuel or listed gas appliances. Refer to the manufacturer's installation manual for detailed description of clearances to combustibles and all other installation information.

A metal listing label similar to those shown above is affixed to each fireplace. Do not remove the listing label from the fireplace.

Prior to beginning installation, contact your local building official to determine the need to obtain a permit.

STANDARD 36 (80S36)

CAUTION: When using the Isokern brick ledge it is required that the firebox/smoke dome assembly include the placement of a 4" by 4" by 3/8" minimum steel angle across the firebox opening. (See page 33-35 for "Structural Information" for details regarding specification and placement of steel angles in fireplaces.)

NOTE: These are inside rough dimensions before firebrick

Component	Part#	Description	Component	Part#	Description
 A rectangular plate with a width of 25 1/4" and a length of 49".	22	Isokern STANDARD Base Plate	 A rectangular plate with a width of 25 1/4", a length of 33", and a central circular hole with a diameter of 10 3/4". The thickness is 4 3/4".	M77	Isokern STANDARD Top Plate
 A trapezoidal dome-shaped component with a top width of 4", a bottom width of 43", and a height of 16".	11	Isokern STANDARD Smoke Dome (QTY. 2)	 Two trapezoidal components, one for the left and one for the right, with a top width of 4", a bottom width of 43", and a height of 16".	95L & 95R	Isokern STANDARD Damper End Left & Right
 A sloping side component with a top width of 25 1/4", a bottom width of 49", and a height of 16". The thickness is 3".	34	Isokern STANDARD Side Sloping (Qty. 2)	 A rectangular support component with a width of 49", a height of 8", and a depth of 7 7/8".	M69	Isokern STANDARD Damper Support, Front/Back (Qty. 2)
 A rectangular sidewall component with a width of 25 1/4", a height of 8", and a depth of 10 1/2". The thickness is 2 7/8".	20	Isokern STANDARD Sidewall (Qty. 6)	 A rectangular backwall component with a width of 35 1/2", a height of 10.5", and a depth of 10 1/2".	28	Isokern STANDARD Backwall (Qty. 3)

Component List - STANDARD 46 (80S46)

Component	Part#	Description	Component	Part#	Description
 A rectangular plate with a width of 53 inches and a depth of 25 1/4 inches.	23	Isokern STANDARD Base Plate	 A rectangular plate with a width of 43 inches, a depth of 25 1/4 inches, and a central circular hole. The hole has a diameter of 10 3/4 inches. The plate has a thickness of 4 3/4 inches.	M81	Isokern STANDARD Top Plate
 A trapezoidal dome-shaped component with a top width of 4 inches, a bottom width of 53 inches, and a height of 16 inches.	13	Isokern STANDARD Smoke Dome (QTY. 2)	 Two trapezoidal components, one for the left and one for the right, with a top width of 4 inches, a bottom width of 53 inches, and a height of 16 inches.	95L & 95R	Isokern STANDARD Damper End Left & Right
 A trapezoidal sloping component with a top width of 25 1/4 inches, a bottom width of 53 inches, and a height of 16 inches. It has a sloped side with a thickness of 3 inches.	34	Isokern STANDARD Side Sloping (Qty. 2)	 A rectangular support component with a width of 53 inches, a depth of 8 inches, and a height of 7 7/8 inches.	M70	Isokern STANDARD Damper Support, Front/Back (Qty. 2)
 A rectangular sidewall component with a width of 25 1/4 inches, a depth of 8 inches, and a height of 10 1/2 inches. It has a sloped side with a thickness of 2 7/8 inches.	20	Isokern STANDARD Sidewall (Qty. 6)	 A rectangular backwall component with a width of 40 inches, a depth of 10 1/2 inches, and a height of 10 1/2 inches.	31	Isokern STANDARD Backwall (Qty. 3)

Required Clearance to Combustibles

FIGURE 1

FIGURE 2

The STANDARD Series fireplace and the DM chimney system is tested and listed for installation with "clearance to combustibles" as follows:

All DM 54 chimney components require 0" clearance.

(Figure 1)

The STANDARD Series firebox side walls and back wall require 1 1/2" clearance. **(Figure 2)**

The smoke dome front wall requires 0" clearance.

NOTE: "Combustibles" are defined as "normal construction materials" and are considered to be wood framing materials, particle board, mill board, plywood sub-flooring, plywood paneling and wood flooring.

STANDARD Series fireplaces are tested and listed for (1 1/2") clearance to combustible framing material at the firebox sides and back.

Installation and use practices that are beyond the control of the manufacturer* can result in situations where clearance requirements (as determined through testing and as stated by the manufacturer) are not maintained due to construction after the installation of the Isokern unit. It is the general contractor's responsibility to assure that listed clearances to combustible framing and to insulation are maintained throughout the construction of the project after the installation of the Isokern unit.

To avoid causing a fire resulting in damage to property, personal injury, or loss of life, do not pack or fill the required air spaces with insulation or other material. No material is allowed in these areas. **(Figures 2 & 3)**

Keep all insulation, vapor barriers, "house wrap" paper and other insulating type membranes and products, including fiberglass, cellulose and other insulation, (anything that carries an "R" rating) a minimum of three inches (3") away from all firebox and chimney surfaces.

IMPORTANT: The manufacturer is not responsible for installation and use practices that are beyond the scope of the product as defined in the product listing and in this installation manual.

Sheathing materials, such as plywood, particle board and drywall may cover the smoke dome front at 0" clearance. All combustible sheathing materials that protrude beyond front of firebox:

Models 36, 42 & 46:

- Sides: 8" away
- Top of opening: 8" away

Drywall must be cut back from the firebox opening sides and above the top of the opening according to information above.

Required Clearance to Combustibles

EXCEPTION: If insulation is used in walls surrounding the fireplace, insulation may be installed behind sheathing of gypsum board, plywood, particle board or other material on the side facing the Isokern. The facing material cannot be within 1 1/2" to the fireplace sidewalls.

The STANDARD Series fireplace must sit upon a concrete support slab designed to bear the total installed weight of the fireplace and DM chimney system. These support slabs can have no wood underpinnings. (**Figure 3**) See page 18 for more information on weight loads.

Concrete support slabs for STANDARD Series fireplaces must provide the non-combustible hearth extension substrate needed to support the code required non-combustible hearth extension finish materials. (**Figures 4**)

All STANDARD Series fireplaces shall have hearth extensions of approved non-combustible material such as brick, tile, or stone that is properly supported and with no combustible material against the underside thereof. Wooden forms used during the construction of hearths and hearth extensions must be removed when the construction is complete.

If a raised fireplace floor and raised hearth extension are preferred, the raised underlying structure must be built of non-combustible material, be structurally designed to hold the weight of the fireplace and chimney system and must sit on non-combustible substrate.

FIGURE 3

FIGURE 4

Supporting Floor System

FIGURE 5

The STANDARD 36, 42, and 46 Fireplaces are not rated for installation on a combustible floor system unless used in the Fire-Lite Application. (See Page 17-19) Fireplaces must be built upon a concrete support slab with no wood underpinnings. Proper reinforced concrete support slab for fireplace installations may include the following types:

1. Slab on grade: standard residential, minimum four inch (4") thick, 2500 psi concrete foundation on properly compacted fill. This type of foundation can support Isokern installations up to thirty feet (30')* overall height without additional structural support. (brick ledge installations not included) **(Figure 5)**

* Minimum height. See page 3 for specific models.

2. Slab-on-grade foundations thickened and reinforced: for additional load carrying. **(Figure 6)**

3. Off-grade slab on foundation walls and footings

Projects with off-grade floor systems as well as upper story installations require this type of support. When building off-grade support slabs the code required hearth extension substrate should be built as a continuation of the support slab for the fireplace unit. **(Figure 7)**. Supports for off grade slabs must be concrete or steel and capable of supporting the slab, Isokern unit and the chimney.

For multi-floor and back-to-back installations proper weight computation on an individual basis is required. Consult a local structural engineer for load bearing requirements.

IMPORTANT: Foundations and footings must meet local code and be approved by the local building authority. For any foundation design and load requirements check with a local structural engineer. **It is the responsibility of the General Contractor to insure adequate foundations.**

Fireplace weights* and "footprint" areas: The total fireplace weight and footprint for each model listed below includes fireplace pumice components only:

STANDARD 36: 1300 lbs. @ 43" x 25" = 7.5 sq.ft.

STANDARD 42: 1420 lbs. @ 49" x 25" = 8.5 sq.ft.

STANDARD 46: 1600 lbs. @ 53" x 25" = 9.2 sq.ft.

"Footprint" areas listed above are base plate dimensions for each model and are exclusive of code required hearth extension areas. See page 59 for hearth extension dimensions.

NOTE: Additional support slab area may be required at the side or back of the STANDARD unit to provide bearing for structural supports to a DM offset chimney sequence. (See page 32 – 34 for offset chimney support requirements.)

FIGURE 6

FIGURE 7

Fire-Lite Application

General Information:

The Fire-Lite is an application of the Isokern STANDARD 36, 42 and 46 fireplaces designed, tested, and listed with the ability to be installed on a combustible floor system. The design and installation require that the system use ECO-STEEL or ECO-STEEL+ metal chimney. The Isokern Fireplaces must sit on the Fire-lite stand using the applicable Fire-lite kit.

The following pages will refer to installation requirements specific to the Fire-Lite application using the Isokern Metal Fire-Lite Stand (Pages 21-25).

Intended Use Statement:

The Fire-Lite Application of the Isokern fireplace is designed to sit on a combustible floor system and is intended to burn solid wood fuel, propane, or natural gas. The fireplace is intended for use as a supplemental heat source only and is not intended for heavy use as a primary heating system.

The Fire-Lite has been tested and listed by Warnock Hersey (Report Nos. J20004277-231 and 632-912500) to UL 127-1999. These units are intended for installation in residential homes, and other buildings of conventional construction.

Fire-Lite Application of the Isokern fireplace are also designed for installation in accordance with the National Fire Protection Association Standard for chimneys, fireplaces, vents, and Solid Fuel-Burning Appliances (NFPA211).

Clearance to Combustibles:

The Fire-Lite is tested and listed for installation with "clearance to combustibles" as follows:

1. Four inches (4") clearance to the combustible floor.
2. Zero-inch (0") clearance at the Isokern smoke domefront wall.
3. One- and one-half inches (1 ½") clearance at the Isokern firebox back walls and side walls.
4. Two inches (2") minimum air space to combustibles at all ECO-STEEL or ECO-STEEL+ metal chimney.

IMPORTANT: "Combustibles" are defined as "normal construction materials" and are considered to be wood framing materials, particle board, mill board, plywood sub-flooring, plywood paneling and wood flooring. Sheathing materials, such as plywood, particle board and drywall may cover the smoke dome front at zero-inch (0") clearance.

gypsum board, plywood, particle board or other material on the side facing the Isokern. **(Figure 8)**

IMPORTANT: The Fire-Lite Application is designed, tested and approved for installation at a minimum of four inches (4") above combustible floor systems per the installation specifications given in this manual.

FIGURE 8

Fire-Lite Application

* Height based on the use of 1 1/4\" fire-brick and a 1/4\" mortar bed.
This height may vary based on the firebrick used.

FIGURE 9

All portions of the combustible floor system under the Fire-Lite stand are to be covered with minimum 1/2\" thick ceramic fiber Isowool or equivalent rated to 2100 degrees Fahrenheit. **(Figure 9)**

Use of Insboard cut out underneath the Fire-Lite stand is still an accepted installation practice. **(Figure 9)**

All Fire-Lite Application of the Isokern fireplace result in the finished fire brick floor of the firebox being at least eight inches (8 1/2\")* above the combustible floor system. **(Figure 9)**

The noncombustible raised platform must be set with a minimum one- and one-half inch (1 1/2\") clearance to the wall to the sides and directly behind the Fire-Lite assembly.

Raised Platform:

Nominal four-inch (4\") metal base. **(Figure 9)** Set the Fire-Lite base plate in a Earthcore Adhesive on to the non-combustible raised platform.

IMPORTANT: Metal safety strip - a metal angle is attached to the Fire-Lite stand when shipped. This angle is to be removed before installation, turned over and re-attached to the metal stand so that the 2\" lip faces forward of the metal stands. This creates a metal safety strip and can be adjusted to ensure your metal stand, set on top of the Isowool will be level. The safety strip must extend out from the front of the raised platform at least two inches (2\")

The exposed combustible floor underneath the noncombustible raised platform must be completely covered with Isowool ceramic fiber insulation. **(Figure 9)** The Isowool is dry laid to the floor within the block perimeter.

The ceramic fiber must have a thermal conductivity rating equal to or greater than 0.4 Btu-in/hr. sq. ft-degree Fahrenheit. (Reference: Harbison-Walker, 600 Grant St., Pittsburgh, PA 15219, ph. 412-562-6200: "Insboard 2100" or equivalent.)

Fire Brick Installation: Follow instructions on page 49 of this manual.

Fire-Lite Application

Recessed Fire-Lite:

If the design preference is for a flush hearth Fire-Lite application (floor of the fireplace at the same level the room's floor), with advanced planning, the metal stand can be lowered, set, and attached to the joist system. **(Figure 10)**

NOTE: For seismic anchorage design and instructions of the flush hearth application, please contact the Technical Department at 1-800-642-2920.

When calculating flush hearth height be sure to allow for the four- or eight-inch (4" or 8") metal stand, three inch (3") thick base plate plus the one- and one-half inch (1 1/2") thick fire brick floor.

Whether a flush hearth is preferred or a raised hearth, the combustible floor in front of the fireplace must be covered with a noncombustible hearth extension set tight against the fireplace front and extending at least 20 inches out from the finished fireplace and at least 12 inches beyond the finished sides of the fireplace opening.

For all "Fire-Lite" construction, it is necessary to use the base plate and the metal Fire-Lite stand. Be sure to secure the Fire-Lite metal stand to the floor framing system.

NOTE: Field Verified Dimensions Should Make Allowance for Hearth Extensions in Front (20") and Sides (12" ea.) From Fireplace Opening. Also, Fireplace Sides and Rear, 1 1/2" Clearance to Combustibles.

FIGURE 10

Part#	Description
MS-S-36	STANDARD 36 Fire-lite Kit (Stand w/ ISOWOOL) 4" x 46" x 25"
MS-S-42	STANDARD 42 Fire-lite Kit (Stand w/ ISOWOOL) 4" x 49" x 25"
MS-S-46	STANDARD 46 Fire-lite Kit (Stand w/ ISOWOOL) 4" x 53" x 25"

FIGURE 11

Rough Framing Dimensions

Typical Installation Framing Dimensions

<u>STANDARD</u>	Width - A	Height - B	Depth - C
Model 36	46"	65"	26 3/4"
Model 42	52"	65"	26 3/4"
Model 46	56"	65"	26 3/4"

Notes:

1. "B" includes the 3" thick base plate.
2. "Raised hearth" requires additional rough opening height at "B" equal to the height of the raised hearth detail.
3. Rough framing dimension for width "A" allows for the required 1½" clearance at the sides of the Fireplace.
4. Rough framing dimension for Height "B" will need to be increased by 4" if the Firelite application is utilized.
5. Rough framing dimension for depth "C" allows for the required 1½" clearance at the back of the Fireplace. 26 3/4" is only for an interior wall as most exterior wall framing have insulation, even if the wall is 2x6, the foam they spray expands so typically 31" is allowed on an exterior wall (Figure 12).

FIGURE 12

FIGURE 13

Corner Installation Framing Dimensions

The following chart of dimensions detail the positioning of a STANDARD Series fireplace in a corner. It also details the positioning of DM chimney where it must turn 45° degrees if alignment is needed to overhead framing. (Figure 12 & 13)

<u>STANDARD</u>	A	B	C	D
Model 36	46"	23 ½"	32"	69"
Model 42	52"	26 ½"	36"	73"
Model 46	56"	28 ½"	39"	76"

To turn flue 45°, first set starting inner liner onto the top plate of the fireplace.

Next, set a DM outer casing onto the inner liner so that the outer casing is at 45° to the firebox and square to the overhead framing system. Run the vertical DM chimney through the overhead framing.

Offset blocks can be used, if necessary, to align with overhead framing before running the vertical DM chimney outer casing and liner.

NOTE: Support the third offset down to footings and at each third offset block thereafter.

General Assembly Instructions

FIGURE 14

FIGURE 15

FIGURE 16

When beginning the assembly process, mix the Earthcore Adhesive with clean water to a smooth, workable texture (without lumps or dry pockets) of a "toothpaste" consistency. This mixture is suitable for application onto Isokern components by using a masonry grout bag supplied with the unit.

Attention should be paid that the Earthcore adhesive mixture is not too thin or runny, as this will not allow the Earthcore adhesive to reach its maximum bonding strength.

Mark out the position of the base plate on the supporting floor system. Apply a thin layer of Earthcore Adhesive to the area and set base plate in the mortar. **(Figure 14)**

Earthcore Adhesive is then squeezed from a grout bag onto the contact surfaces of the Isokern components as they are fitted together.

NOTE: It is important that a ½" bead of Earthcore adhesive is piped onto all the components' contact surfaces, about ½" in from all edges. **(Figure 15)**

When setting the next component onto the Earthcore, adhesive contact should be on the base plate, some Earthcore adhesive should squeeze out along the face of the entire joint as a sign of complete and proper sealing of the joint. On broader contact surfaces, it is advisable to apply several additional ½" beads of the Earthcore Adhesive to the area to assure proper sealing of the joint.

Properly Earthcore adhesive firebox and smoke dome assembly should approximately 100 pounds (dry measure) of Earthcore Adhesive.

Leveling and Aligning Components:

Be sure to assemble all Isokern components level and flush with adjoining components.

Earthcore Adhesive is not intended to create a Earthcore adhesive joint of any thickness for leveling purposes. **Therefore, leveling and alignment adjustments are made using small plastic shims supplied with the unit. (Figure 16)**

The shims can be inserted under a component to level and align it with adjacent Isokern components. Be sure to re-grout all gaps resulting from shim insertion to maintain components to full bearing.

Broken Components:

Components can be repaired by using Earthcore adhesive along the break line as the component is set into place. Components broken into multiple small pieces should be discarded and replaced.

IMPORTANT:

1. Do not mix Earthcore Adhesive with anti-freeze agents.
2. The maximum recommended Earthcore adhesive joint thickness at Isokern components is ¼".

Assembly Instructions - STANDARD 36, 42 & 46

The following assembly instructions identify the parts by name, part number and the placement of each part in the assembly process.

NOTE: At all component placement, be sure to adhesive all contact surfaces with Earthcore Adhesive. Check for complete sealing of each contact joint while assembly progresses.

1. Set the base plates in a full bed of Earthcore Adhesive on a level support surface. See page 22 for supporting floor system. (**Figure 17**). Do not set the base plate so that it is in span.

Flush Hearth:

If the design preference is for a "flush hearth" the base plate can be omitted from the assembly and the firebox walls built directly on a minimum 4" concrete support slab. The fire brick floor of the firebox is then set directly to the concrete support slab. This makes the fireplace finished fire brick floor approximately one and one-half inches (1 ½") above the top of the concrete support slab.

Raised Hearth:

If the design preference is for a raised hearth (floor of the fireplace elevated above the room's floor), then the base plate can be set on a noncombustible platform that is built up to the desired raised hearth height on the concrete support slab. (Figure 18)

When calculating raised hearth height be sure to allow for the three inch (3") thick base plate plus the one-and one-half inch (1 ½") thick fire brick floor in addition to the height of the platform.

For all "raised hearth" construction where concrete blocks are used to create the raised platform, it is necessary to use the base plate. Be sure to adhesive the concrete block platform together. CMU used for base plate support should be rated ASTM 90.

Whether a flush hearth or a raised hearth is installed, the combustible floor in front of the fireplace must be covered with a noncombustible hearth extension set tight against the fireplace front and extending at least 20 inches out from the finished fireplace and at least 12 inches beyond the finished sides of the fireplace opening.

2. Set the first course of the firebox side walls and back walls into place. (**Figure 18 & 19**)

NOTE: It may be convenient to dry set the first course of side walls and back walls into place on the Isokern base plate and then trace their position on the base plate with a pencil.

After outlining the dry set pieces, remove them and apply Earthcore Adhesive to the areas traced on the base plate where the side walls and back wall are to sit.

FIGURE 17

FIGURE 18

FIGURE 19

Assembly Instructions - STANDARD 36, 42 & 46

FIGURE 20

FIGURE 21

By doing this, the first layer of wall components can be set directly into Earthcore adhesive already applied to the proper areas on the base plate.

3. Continue assembly of the consecutive courses of the firebox side wall and back wall, making sure to stagger the backwall components. Apply adhesive to the top of each layer of wall components, set the next course above into place. Be sure to Earthcore adhesive all vertical joints of the side wall to back wall connection when setting each component to its mate. **(Figure 20)**

Look for some Earthcore adhesive to squeeze out along the joints of all contact surfaces as a sign that the joint is thoroughly sealed with the approved Earthcore adhesive.

4. When all the firebox sidewall and backwall components are set, check the top surface of the firebox for level. If necessary, adjust the top surface of the box assembly for level by inserting a shim supplied with the unit between the lowest wall component and the top surface of the base plate.

Any gap created under the wall components during the Shim leveling process must be filled with Earthcore adhesive to fill bearing against the base plate.

NOTE: If you are using DM Chimney or DM Chimney with a brick ledge, a steel angle iron should be utilized following these instructions.

CAUTION: When using the Isokern brick ledge it is required that the firebox/smoke dome assembly include the placement of a 4" by 4" by 3/8" minimum steel angle across the firebox opening. (See page 50 for "Structural Information" for details regarding specification and placement of steel angles in fireplaces.) This item is not included in the components and can be sourced locally.

5. This steel angle sits on top of the uppermost side wall component with the four-inch leg in the horizontal position. To avoid a thickness problem with the placement of the steel angle it is necessary to cut a notch in the top side wall component where the angle is to sit. This notch should be cut approximately 3/8" deep. The notch should start at the front face of the side wall component (at both the left- and right-hand walls) and run to a point 4" back toward the firebox. **(Figure 21)**

Assembly Instructions - STANDARD 36, 42 & 46

The steel angle sits in this notch. The four-inch leg of the steel angle is in the vertical position and is to be in alignment with the front of the firebox. The ends of the steel angle should not protrude beyond the outer firebox side wall. Earthcore adhesive between the steel and the notch in the top of the side wall is not needed.

6. The fireplaces come with an eight-inch (8") thick damper beam assembly, a four (4) piece component group that is to be assembled on top of the firebox sidewalls and backwall.

The damper beam assembly consists of two (2) long lintel pieces and two (2) short damper beam side pieces.

The damper side pieces are designed to sit on the firebox side wall between the front lintel and the back lintel. Each of the damper side pieces is designed specifically for its own side of the unit. When properly set, each damper side piece fits flush with the outside face of the firebox sidewall so that its interior bottom edge aligns with the interior angle of the firebox side wall that it sits on. **(Figure 22)**

The two (2) lintels will be equal to the width of the fireplace model that they serve. Properly placed, the lintel is to sit on top of the firebox back wall and flush with it; the other lintel sits flush with the front of the firebox, spanning the firebox opening. These components both sit on their narrow base so that their beveled face points down and into the firebox interior. **(Figure 23)**

Be sure to Earthcore adhesive all damper beam components to the top surfaces of the firebox. Earthcore adhesive the contact surfaces of each damper side component where it meets the front and back damper beam lintel components.

NOTE: The firebox and smoke dome are designed to be fitted with a traditional cast iron, poker-style throat damper and placed on top of the damper beams during installation. However, in-line or chimney top dampers are alternative options. The damper is not included with the firebox.

7. With the damper beams assembled and Earthcore adhesive together, set the cast iron throat damper (unless another damper type is being used) on top of the damper beam and over the smoke chamber opening. The cast iron damper's operating plate should face toward the rear of the fireplace. **(Figure 23)** The flange at all four sides of the cast iron damper should be supported by the damper beam's top surface.

Position the cast iron damper so that its front flange is approximately one inch (1") away from the inside face of the front smoke dome component. **(Figure 24)**

FIGURE 22

FIGURE 23

FIGURE 24

Assembly Instructions - STANDARD 36, 42 & 46

FIGURE 25

FIGURE 26

FIGURE 27

Run a thin bead of Earthcore adhesive around the four sides of the cast iron damper or tack the corners of the flange to avoid movement of the damper as it gets opened and closed.

8. Set the rear smoke dome component across the damper beam in a bed of Earthcore adhesive and flush with the back face of the back damper beam lintel.

Set the front smoke dome component in Earthcore adhesive across the front damper beam. The smoke dome component should be flush with the front of the front damper beam lintel. **(Figure 26)**

NOTE: On the STANDARD 42 the smoke dome will not go all the way to the sides of the firebox. There will be 3" on both sides of the smoke dome top. Please see page 10 for reference.

9. Position the smoke dome's sloping sidewalls at each end of the smoke dome components.

The sloping sidewalls fit in between the front and rear smoke dome components and also fit into the haunches at the ends of the front and rear smoke dome components. Earthcore adhesive all contact surfaces thoroughly. The smoke dome sloping sidewalls have a beveled bottom edge so that they will sit tight onto the flat top of the damper beam assembly. **(Figure 26)**

10. Set the top plate into position and Earthcore adhesive on top of the smoke dome wall assembly.

One side of the top plate shows a thickened center. This side is the bottom face.

The flue hole in the top plate is centered in the smoke dome from side to side but is offset from front to back, the center being ten and three-fourths inches (10 3/4") from the back of the firebox. **(Figure 27)**

DM Chimney Components & General Information

The DM chimney is a dual module, refractory masonry chimney system. It is composed of two precast mating components, the outer casing liner, and an inner liner.

This chimney system is designed for installation in accordance with the National Fire Protection Standard for Chimneys and Solid Fuel-Burning Appliances, NFPA 211 and in accordance with codes such as ICC, BOCA Basic/National Codes, the standard Mechanical Code, and the Uniform Building Codes.

Required DM Chimney Clearance

The DM chimney system, rated UL 103HT, is listed for zero clearance to normal construction materials. The DM chimney system may be enclosed in a wood chimney chase at zero clearance to wood framing members.

Since lateral support is required for DM chimneys the framing members will be in contact with the DM chimney system.

IMPORTANT: "Combustibles" are defined as "normal construction materials" and are considered to be framing materials, particle board, mill board, drywall, plywood paneling, plywood sub flooring, and wood flooring.

Keep all insulation, vapor barriers, "house wrap" paper and other insulating type membranes and products, including fiberglass, cellulose and other insulation, (anything that carries an "R" rating) a minimum of three inches (3") away from all firebox and chimney surfaces.

EXCEPTION: If insulation is used in walls surrounding the fireplace, insulation may be installed behind sheathing of gypsum board, plywood, particle board or other material on the side facing the Isokern. The facing material cannot be within 1 1/2" to the fireplace sidewalls.

Mechanical Vent Systems

It is acceptable to use mechanical draft systems, if the venting companies do the engineering calculations and make the necessary recommendations for fan size and flue vent diameter following the guidelines of NFPA 211/2006, pg. 211-13. Installation of such systems must also follow the mechanical drafting company's explicit installation and operation instructions.

Isokern DM Chimney Weights

Total installed chimney weight will vary and be based on the overall height and the configuration of the chimney system. Chimneys may be straight vertical stacks of DM outer casing and inner liner (See page 3) but may also include the use of offset chimney blocks, brick ledge, chimney reinforcement, brick/stone veneers, cement crown caps and clay chimney pot termination with additional structural support.

Component	Part#	Description
	70003	Isokern DM Chimney 6" Inner Liner
	70235	Isokern DM Chimney 12" Inner Liner
	45433	Isokern DM Chimney 12" Outer Liner
	40136	Isokern DM Chimney Offset Block
	40111	Isokern Brick Ledge
	40322	Isokern Small Crown Cap
	40323	Isokern Large Crown Cap
	50001	ISO-Cap Spark Arrestor - Stainless Steel
	50003	ISO-Cap Spark Arrestor w/Damper - Stainless Steel (Shown) Fits Inner Liner
	50004	ISO-Cap Spark Arrestor - Black Galvanized Fits Outer Liner
	50006	ISO-Cap Spark Arrestor - Copper Fits Inner Liner

DM Chimney Components Weight & Height Requirements

The DM chimney component weights are as follows:

Small crown cap:	80 lb.
Large crown cap:	100 lb.
Brick ledge:	110 lb.
6" Inner Liner:	19 lb.
12" Inner Liner:	45 lb.
Outer Casing:	90 lb.
Offset block*:	110 lb.

*Construction of an offset block sequence will shift a portion, if not all the chimney load off the firebox and smoke dome. Additional reinforced concrete footing and slab area may need to be provided adjacent to or as a continuation of the primary support slab area for bearing the steel or masonry support required for an offset sequence. (See pages 30-31) Consult a structural engineer for specific, individual structural requirements.

NOTE: Plan chimney configuration carefully before constructing the required reinforced concrete support foundation for the fireplaces. Be sure that enough structural masonry area is available to support any offset chimney sequence included in the proposed chimney design. (See Page 31)

Earthcore is not responsible for site specific structural support details and load specifications for fireplaces and DM chimney system installations. Consult local structural engineer for proper job-specific support structure design, sizing and load bearing specifications.

Unless otherwise noted, all floor drawings in this manual are merely illustrations to indicate the presence of an underlying noncombustible support structure to the fireplace installation.

The required minimum chimney height above the roof and adjacent walls and buildings is specified by all major building codes and is summed up in what is known as "the 2 foot in 10-foot rule":

(1) If the horizontal distance from the roof ridge to the opening of the chimney is less than 10', the top of the chimney must be at least 2' above the roof ridge.

(2) If the horizontal distance from the opening of the chimney to the roof ridge is more than 10' then a chimney height "work point" is established on the roof surface 10' horizontally from the opening of the chimney. The top of the chimney must be at least 2' above this work point.

(3) In all cases, the chimney cannot be less than 3' above the roof at the edge of the chimney. (**Figures 39 & 40**)

A simple example of this would be if the roof is flat then the chimney would need to be at least 3' above the roof surface. Or, if the chimney penetrates the roof at the ridge, then the chimney must be at least 3' above the ridge. (**Figure 41**)

NOTE: The "2 foot in 10-foot rule" is necessary in the interest of fire safety but does not ensure smoke-free operation of the fireplace. Trees, buildings, adjoining roof lines, adverse wind conditions, etc. may require a taller chimney for the fireplace to draft properly.

As with all chimney installations, avoid overhead obstructions such as trees, power lines, etc.

FIGURE 28

FIGURE 29

FIGURE 30

DM Chimney Installation - Straight Run

Where the chimney run is to be straight run the DM chimney by setting a DM outer liner in a bed of Earthcore adhesive on top of the STANDARD top plate where the outer liner is centered from side to side and flush with the back of the top plate. Be sure that the outer liner aligns with the flue hole in the top plate. Set in this way the DM outer liner will sit three and three-fourths inches ($3\frac{3}{4}$ ") back from the front face of the top plate.

This total set-back distance makes it possible for a three and one-half inches ($3\frac{1}{2}$ ") thick bearing header to pass over the STANDARD firebox smoke dome assembly and for the DM chimney to run straight up the back side of the bearing header. **(Figure 31)**

Next set the DM chimney inner liner's six inch (6") tall "starter" piece inside the first outer liner. The six inch (6") tall inner liner has a female end and a flat end. Set this inner liner with the flat end down. Be sure that the stater piece is set into the Earthcore Adhesive so it is fully sealed to the top plate.

IMPORTANT: Earthcore adhesive all outer liners together and Earthcore adhesive all inner liners together. Do not Earthcore adhesive the air space between the liners and the outer casing blocks.

Every 12' of DM54 Flue you should order a bucket of Earthcore Adhesive MP50

Starting with the six inch (6") tall inner liner starter piece creates six inch (6") staggered horizontal joints between the inner liner and the outer liner as the chimney is built up.

Both the outer liner and the inner liner components have tongue and groove type detailing on each end to assure alignment and interlock of the pieces as they are stacked and glued together.

NOTE: If the six inch (6") inner liner starter piece is broken or otherwise unavailable then a full twelve inch (12") tall inner liner piece can be cut to six inches (6") in height to make an inner liner starter piece.

After setting the DM inner liner starter piece, apply Earthcore adhesive to the top of the starter liner. Continue the straight chimney run by placing a full height inner liner onto the six-inch (6") starter liner. The top of this full height inner liner will sit 6" above the top of the outer casing block that was previously set.

This six-inch (6") offset between joints of the inner liner stack and the joints of the outer casing stack continues to the top of the chimney run.

Continue the straight vertical DM chimney by setting an outer liner onto the Earthcore adhesive top surface of the preceding outer liner. The grooves on the bottom end of the upper outer liner fit onto the tongues on the top of the lower outer casing block. This assures proper alignment of the two components.

FIGURE 31

DM Chimney Installation - Straight Run

FIGURE 32

FIGURE 33

Next place a full height inner liner onto the Earthcore adhesive top end of the previously set inner liner. Proceed this alternate stacking of outer liner and inner liners until the desired height of the flue is attained.

Lateral Support for DM Chimneys

Though not required, it is recommended that where the DM chimney is built up along an exterior wall the vertical chimney system can be connected to the structural wall system at a minimum of four-foot (4') intervals. This connection can be made using 18-gauge strap ties (Simpson Strong Tie CS coil strap, or equivalent).

Starting on one side of the DM chimney, at four-foot (4') intervals up the structural wall adjoining the chimney, connect one 18-gauge strap tie to the structural wall with two, three-inch (3") #8 (minimum) wood screws or masonry anchors, as appropriate.

Next fold the strap around the three exposed sides of the outer casing. Connect the strap to each of the three outer casing faces with two, one and one-half inch (1 1/2") long masonry anchors, such as "Tapcon" or "Titen" screws. Fasten the strap back to the structural wall with two three-inch (3") #8 (minimum) wood screws or masonry screws, as appropriate. **(Figure 32)**

Where DM chimneys are built up from the interior walls the DM chimney outer casing block is to be laterally braced at ceiling and roof penetrations.

Pressure treated two-inch (2") by four-inch (4") blocks, set at each side of the flue between the trusses or rafters and fastened to the pre-engineered roof trusses or rafters with two 16d common nails at each end, provides lateral support, parallel with the framing. Additionally, a two inch (2") by four inch (4") by six feet (6') minimum pressure treated member ("rat run") installed on each side of and butted up to the outer casing block will provide lateral support perpendicular to the direction of the truss or rafter framing system.

Fasten the perpendicular member with two 16d common nails to each intersecting truss or rafter. The perpendicular bracing should be installed on the top side the ceiling level framing as well as on the bottom side of the rafters. **(Figure 33)**

DM Chimney Installation - Offset Run

DM Offset Block

For vertical DM chimney to bypass overhead obstructions, the Isokern offset chimney block is used.

Offset blocks are six inch (6") thick, single module chimney components, measuring twenty-one and one-half inch (21 1/2") wide by twenty-five inches (25") long. The fourteen-inch hole passes through the block at thirty (30°) degrees. An offset chimney block can be set as the first flue component on top of the STANDARD top plate.

Offset chimney block sequences can be built to shift the chimney run to the left, right or to the rear of the firebox/smoke dome assembly.

Offset blocks can be set in a spiraling rotation, thus moving the chimney to a point that is diagonally away from its starting point.

Offset blocks require 1 1/2" to combustible framing.

DM Chimney Offset Block Installation and Support Foundations

Isokern offset chimney blocks are stacked in a stair step fashion with each successive block overhanging the previous offset block by three inches (3"), allowing the flue to rise at an angle of thirty (30°) degrees off vertical. **(Figure 34)**

Each offset block is to be set fully in a bed of Earthcore Adhesive, completely sealing each offset block to the underlying component. When placing the first inner liner on top of the last offset required, seal the space between the inner liner and the offset block so that no smoke will be able to spill through the two joints.

When building offset sequences, it is necessary to support the third offset block in the sequence and every third offset block thereafter to footings via concrete block or steel support columns. When using only one or two offset blocks no additional support is required. During this building process it is important to check the interior flue alignment as each offset block is set to avoid creating overhanging ledges on the inside of the flue. Such internal overhangs will inhibit flue drafting.

Offset sequences are best when built as low as possible in the chimney run to maximize performance. If a DM Offset sequence cannot be done at the beginning of the chimney sequence, you must consult a structural engineer to ensure proper support is in place for the DM Chimney Offset.

Plan fireplace and DM chimney systems carefully before foundations are laid to assure that proper footings are available to support Isokern offset blocks chimney run.

To calculate the distance of Isokern offset chimney travel in a straight line to the right, left or to the rear of the firebox/smoke dome assembly, proceed as follows:

Temporarily dry set a DM outer casing block in its proper location on top of the completed firebox/smoke dome assembly as though starting a straight chimney. **(Figure 35)**

FIGURE 34

FIGURE 35

DM Chimney Installation - Offset Run

FIGURE 36

FIGURE 37

If the offset sequence is to move to the left, then, starting from the right side of the temporary DM outer casing measure left ward to the far face of the overhead obstruction that needs to be bypassed by the vertical chimney run.

For accurate measuring drop a plumb line down from the far face of overhead obstruction to the level of the top of the smoke dome assembly. Measure from the far side of the temporary DM outer casing to the plumb line. This measurement, taken in inches and divided by three (three inches of horizontal travel per offset block) gives the total number of offset blocks needed to accomplish the required travel distance.

To calculate the height that the offset block sequence will require, take the total number of offset blocks needed to accomplish the travel distance (described above) multiplied by 6". This number is the height (inches) that the offset sequence will require.

When establishing the "far face" of the overhead obstruction, be sure that the DM chimney blocks can run straight to chimney termination without further overhead obstruction since a second offset sequence is not allowed. **(Figure 36 & 37)**

Be sure that there is sufficient space beyond the "far face" of the overhead obstruction to accept the DM chimney's outer casing dimension of 21 1/2".

IMPORTANT: Always support the last offset block in a sequence for full support of the DM chimney where it returns to vertical.

Support columns often carry most of the total load of the vertical chimney that is set onto the last offset block.

The total chimney weight above the last offset block will be the total weight of the vertical chimney plus any additional allowable loads such as the Isokern brick ledge, its related brick or stone veneers, and any crown caps, clay pots or other masonry chimney terminations.

Be sure the foundation under all support columns is made of concrete or steel and designed to support the loads applied to it. Do not make support columns of brick, stone, or wood. All support columns must bear onto proper non-combustible foundations.

DM Chimney Installation - Offset Run

FIGURE 38

Offsets to the Left or Right:

When offsetting chimneys to the left or right of the firebox it is not possible to build a support column directly under the third offset block.

To create proper support, construct a support column against the firebox from bearing up to the level of the smoke dome. Bridge from the column over to bearing on the smoke dome with two pieces of four-inch (4") by four-inch (4") by five-eighths inch (5/8") steel angle. **(Figure 38)**

On the steel angles build a masonry or steel support column up to the underside of the third offset block in the sequence. **(Figure 38)**

NOTE: For offset chimney block sequences that clear the side wall of the firebox below, it is allowable to support the first offset block that clears the firebox side wall and then to proceed with supports at each third offset block thereafter. **(Figure 38)**

DM Brick Ledge

FIGURE 39

BRICK LEDGE

The DM brick ledge is a 31 1/2" x 31 1/2" x 3" thick, 32-1/2" square, steel reinforced, concrete and pumice slab. It provides a 5" ledge at all four sides of the outer liner block and is designed to support masonry veneers to DM chimneys starting below the rafters and continuing to termination. **(Figure 39-40)**

The component is cast with an octagonal hole in its center so that the DM octagonal inner liner can pass through it.

The brick ledge has four 2-1/2" holes through it that align with the hole in each of the four corners of the DM outer liner block. These four holes are provided for reinforcement of the chimney stack by the insertion of #4, minimum, steel reinforcing rods and subsequent grouting. **(Figure 40)**

The brick ledge is intended for use in chimneys that rise through the roof only where all four sides of the chimney are bounded by the roof.

IMPORTANT: To maintain structural performance the DM brick ledge must not be cut or altered in any way.

DM Brick Ledge Installation

Use of the brick ledge will require a roof framing rough opening of at least 34" in width. The required opening dimension along the length of the rafter, where

DM Brick Ledge

the chimney is to penetrate the roof line, will increase above 34" relative to the pitch of the roof.

As the DM outer casing and inner liner assembly approaches the roof penetration set an outer casing block to a level of approximately 6" below the low side of the roof framing. **(Figure 40)**

The alignment tongues on the top of this outer casing block must be ground off to leave a flat contact surface for the brick ledge. Temporarily leave out the inner liner that fits this outer casing block.

Set the Isokern brick ledge onto the flat top surface of the outer casing in a full bed of Earthcore Adhesive. Be sure to align the four 2-1/2" holes in the brick ledge with the matching holes in the outer liner block below it. Return to setting the next inner liner in the sequence. This inner liner comes up from below and passes through the octagonal hole in the brick ledge. The liner's top end will be approximately 3" above the top surface of the brick ledge. Set the next outer liner block onto the top of the brick ledge in a bed of Earthcore Adhesive.

Insert one piece of #4 (minimum) steel reinforcing rod into each of the four 2-1/2" holes in the brick ledge. The reinforcement rods must start from a depth of at least 18" below the bottom of the brick ledge. (In some cases, a minimum recommendation could be 5')

If short lengths of steel rods are used be sure to properly lap and wire tie all splices in the rebar. As the reinforcing progresses, completely fill the holes with grout. Suitable grout can be a pourable mixture of Portland cement and sand or Portland cement, sand, and pea gravel. The rebar must be fully embedded in grout.

Leave enough of the #4 steel reinforcing rod exposed above the brick ledge so that as the stacking of outer casing blocks continues to termination the reinforcing rods and grout can continue through the stack. Reinforcing shall continue to chimney termination.

All DM chimneys that include the DM brick ledge must be reinforced as described above.

CAUTION: When using the Isokern brick ledge it is required that the STANDARD firebox/smoke dome assembly include the placement of a 4" by 4" by 3/8" minimum steel angle across the firebox opening.

FIGURE 40

DM Brick Ledge

Lateral Support for Isokern Brick ledge Chimneys

Once the DM chimney and brick ledge are assembled and after the intended masonry veneer has been installed on the brick ledge, be sure to brace the chimney following the guidelines of this manual for Lateral Support of DM chimneys.

Load Capacity for DM Brick ledge

The sources of load delivered into the Isokern brick ledge are: (1) the total physical load of brick, stone, or other masonry veneer on the brick ledge, and (2) loading due to the force of wind delivered against the exposed height of the chimney mass.

The required height of any chimney is governed by applicable local building codes. The overall finished height of any chimney varies based upon site-specific conditions (e.g., elevation of roof line, roof pitch, distance of the chimney from the ridge, etc.).

It is relatively simple to calculate the total physical load on the brick ledge resulting from the physical weight of applied veneers built to code height. However, calculation values for load to the brick ledge due to wind are site specific and based on local variables such as wind speed zone, exposure classification, eave height and roof pitch of the structure, as well as height of chimney mass exposed to wind.

IMPORTANT: The total load delivered into the brick ledge is job specific and will be the sum of:

- (1) the physical load from veneers, plus
- (2) the load due to wind.

The total physical load and load due to wind must not exceed ninety-four hundred (9400) pounds.

IMPORTANT: Do not subject the brick ledge to unequal loading when applying veneers. Build veneers equally on all four sides of the brick ledge.

Brick ledge Veneer Finish and Flashing Details

When applying brick, stone, or other masonry veneer to the Isokern brick ledge standard good building practices for masonry veneer work should govern weather-proofing details and the placement of flashings.

A typical flashing detail would be to field fabricate an aluminum or galvanized sheet metal flashing, approximately thirty-two inches (32") square with a twenty inch (20") square hole in it, to serve as an inner flashing.

DM Brick Ledge & Crown Caps

Place the inner flashing on the first DM outer casing block that fully clears the roof line. Keep the flashing to about a one-half inch (1/2") lap onto the top of the outer casing block. The twenty inch (20") square hole in the flashing should fit to the outside of the alignment grooves on top of the DM outer casing. Continue the DM chimney up to the required termination height.

Once the masonry veneer is in progress the inner flashing is set into a horizontal joint in the veneer at a level above all other roof deck flashings, chimney-to-roof flashings, and counter flashings. Weep holes should open to the outer face of the veneer at vertical mortar joints located at the level of the inner flashing. **(Figure 42)**

Where moisture may develop between the DM outer casing and the chimney veneer, inner flashings as described above will help to divert such moisture to exterior face of the veneer by way of the weep holes and thereby keep such moisture from working its way down between the veneer facing and the DM outer casing and into the interior of the structure below.

DM Small Crown Cap

The DM small crown cap is a prefabricated cement weather cap that measures 26- 1/2" square and 3" thick. The small crown cap is designed and installed the same as the large crown cap. **(Figure 43)**

The small crown cap is intended for use where DM chimneys are to receive thin veneers and cultured stone that do not require the installation of the Isokern brick ledge. The small crown cap is also suitable where DM chimneys are to receive a stucco finish. Other chimney terminations are possible with DM chimneys. Check local codes for use of custom chimney terminations and decorative shrouds.

DM Large Crown Cap

The DM large crown cap is a prefabricated cement weather cap for masonry veneer chimneys. The large crown cap measures 37-1/2" square and is 3" thick at its center. **(Figure 44)**

The component has an octagonal hole at its center so that the top inner liner of the DM chimney stack can pass through it. The crown cap then sits on the topmost DM outer casing block.

To set the large crown cap the last inner liner should be at least 3" above the last outer casing block in the chimney stack.

Mortar the top of the last outer casing block. Set the large crown cap over the inner liner and onto the top of the last outer casing in the stack.

Caulk or mortar the joint between the octagonal liner and the crown cap where the liner comes through the top surface of the large crown cap.

FIGURE 42

FIGURE 43

FIGURE 44

DM 54 Chimney Terminations

ISO-Cap

The Iso-Cap is a Spark Arrestor/Rain Cap designed to fit atop the Isokern DM 54 Chimney Inner Liner and is available in Stainless Steel, Black Galvanized, Copper or a Stainless Steel with Damper. **(Figure 45)**

A 14" diameter sleeve projects from the bottom of the ISO-Cap and inserts into the DM 54 Inner Liner. A two inch (2") wide flange at the base of the ISO-Cap cover the top surface of the DM 54 Inn Liner to protect the liner from weather.

To Install the ISO-Cap silicone caulk is used to adhere the two-inch (2") flange to the top of the DM 54 Inner Liner.

FIGURE 45

Decorative Clay Pots

The Elemental Clay Pots are set in a bed of Earthcore adhesive on the DM 54 Chimney Inner Liner. The base of the chimney top need not match the dimensions of the inner liner it is being installed on top of but should not impinge on the inside area of the flue liner except for the maximum 3/4 of an inch in the corners. The flue liner may extend up inside the chimney top, or the flue liner may be flush with the top surface of the chimney cap. Additional anchoring may be used to prevent damage from tornadoes, hurricanes, or earthquakes. A 1/4 - 1/2-inch diameter hole may be drilled in at least two opposite sides of the chimney top and a bar used to anchor the top into the grout or the chimney walls. **(Figure 46)**

FIGURE 46

NOTE: The Elemental Clay Pots can only be installed on the DM 54 Chimney System. The Clay Pots are not tested and listed for use with Metal Chimney Flue Systems.

Custom Chimney Caps

A non-combustible, weather tight chase flashing must be used to cover the top of the chimney chase. Be sure to seal the joint where the DM liner passes through the chase top flashing for positive weather seal. Chase flashings may be supplied by others. **(Figure 47)**

Special design caps may be designed and constructed by others and must be fashioned so as not to restrict the flow of smoke and gases out the top of the flue opening. The figure below depicts common chimney terminations.

Check with local building codes to establish the need for chimney caps and spark arrestors or for any limitations to their design and use.

FIGURE 47

ECO-STEEL & ECO-STEEL + Metal Chimney Flue

The STANDARD Series Fireplaces are tested and listed for use only with Earthcore's Proprietary ECO-STEEL & ECO-STEEL + chimney systems complying with UL103/ULC-S604 Standard.

Metal Chimney Types:

ECO-STEEL

A lightweight venting solution created so each section connects securely together. This versatile system has a 12-5/8" inner diameter and 15-5/8" outer diameter and is available in two options. Eco Steel Class A Insulated has a Stainless-Steel Outer and Inner Pipe.

Air Cooled Chimney Features

- Double wall, non-insulated
- Locking-tab design

Insulated Chimney Features

- Double wall with solid-pack insulation
- Locking-tab design

ECO-STEEL+

A lightweight venting solution created so each section connects securely together. This versatile system has a 13" inner diameter and 16" outer diameter and is available in two options.

Air Cooled Chimney Features

- Double wall, non-insulated
- Twist lock design

Insulated Chimney Features

- Double wall with solid-pack insulation
- Screw assembly

Note: ECO-STEEL & ECO-STEEL + are not designed for use on products that operate at continuous temperatures more than, intermittent temperatures of 1700° F are acceptable. Only use 1000° F approved terminations and chimney shrouds provided by Earthcore. Be sure to maintain a 2" clearance to combustibles around the metal chimney flue. Eco Steel Plus Insulated has a Stainless-Steel Inner and Galvalume Outer Pipe.

ECO-STEEL & ECO-STEEL + General Information

The ECO-Steel Air-Cooled and Insulated Chimney is intended for use on Isokern fireplaces. Do not use with forced draft or positive-pressure appliances. The ECO-Steel Air-Cooled and Insulated chimney system is designed to extend a maximum of 60 feet vertically and with a maximum of two (2) offset (four elbows total) of up to 30° from vertical. Contact Local Building or Fire Officials about restrictions and installation inspection in your area. These instructions must be followed in all details and failure to do so may result in a hazardous installation.

ECO-STEEL Air-Cooled Chimney is not designed for use on products that operate at continuous temperatures more than 1000° F. The following instructions are a general representation for ECO-STEEL & ECO-STEEL+ Chimney Installation.

Creosote and Soot – Formation and Need for Removal
When wood is burned slowly, it produces tar and other organic vapors, which combine with expelled moisture to create creosote. The creosote vapors condense in the relatively cool chimney flue of the slow burning fire. As a result, creosote residue accumulates on the flue lining. When ignited, the creosote makes an extremely hot fire. The chimney should be inspected at least once every two (2) months during the heating season to determine if a creosote or soot buildup has occurred. If creosote or soot has accumulated, it should be removed to reduce the risk of chimney fire.

Chimneys must be installed so that access is provided for inspection and cleaning.

Never fill any required clearance space with insulation or any other building materials surrounding the chimney.

Do not use a fireplace for food grilling. Grease from foods can collect in chimney causing fireplace to become a potential fire hazard.

Some chemical Chimney cleaners can be harmful to the chimney. These cause accelerated oxidation or corrosion. If chemical cleaners are used, they must be non-corrosive in nature. If a brush is used, it must be of proper size with plastic bristles. Have your chimney cleaned by a professional, certified chimney sweep.

If a flue fire occurs, close all possible air inlets, and call your Fire Department. Do not use the chimney again until it has been inspected by a Certified Chimney Sweep for possible damage.

Exterior metal parts, with exception of the top portion of the chimney cap, can be painted with a high temperature rust proof paint. Wash the metal surface with a vinegar and water solution to remove any residue before painting. Painting the chimney will help to increase chimney life.

Earthcore assumes no liability for structural damage or roof contamination as the result of creosote formation. It is the owner's responsibility to comply with inspection and cleaning requirements as described in these

instructions, and those of the appliance manufacturer.

Interior chimneys shall be enclosed where they extend through closets, storage areas, occupied spaces, or anywhere the surface of the chimney could be contacted by persons or combustible materials. **The air space between the outer wall of the chimney and the enclosure shall not be less than 2 inches.**

WARNING: Do not place any type of insulation or other materials in the required clearance spaces surrounding the chimney assembly.

Except for installation in one- or two-family dwellings, a factory-built chimney that extends through any zone above that on which the connected appliance is located is to be provided with an enclosure having a fire resistance rating equal to or greater than that of the floor or roof assemblies through which it passes.

In cold climates, chimneys mounted on an outside wall should be enclosed in a chase. Exterior chases reduce condensation and creosote formation and enhance draft.

Proper planning for your ECO-STEEL or ECO-STEEL + Air-Cooled Chimney installation will result in greater safety, efficiency, and convenience. You must use only ECO-STEEL & ECO-STEEL + Chimney parts and components to maintain a listed chimney system. Do not mix parts or try to match with other products or use improvised solutions.

Install your Isokern fireplace as described in this installation manual and maintain all required clearances.

Connect only one fireplace per chimney. Follow the fireplace safety manual for maximum efficiency and safety. Do not over fire. Any damage to the fireplace or chimney can possibly void the warranty.

Do not burn driftwood, plastic, or chemically treated wood such as railroad ties. They are corrosive to your chimney system.

A MAJOR CAUSE OF CHIMNEY RELATED FIRES IS FAILURE TO MAINTAIN REQUIRED CLEARANCE (AIR SPACES) TO COMBUSTIBLE MATERIAL. MINIMUM CLEARANCE FOR 13" DIAMETER AIR-COOLED AND INSULATED CHIMNEY IS TWO (2) INCHES. IT IS OF UTMOST IMPORTANCE THAT THIS CHIMNEY IS INSTALLED ONLY IN ACCORDANCE WITH THESE INSTRUCTIONS.

ECO-STEEL Metal Chimney Installation

1. Mount Anchor Plate: Chimneys for Isokern fireplaces begin with an Anchor Plate or Anchor Plate with Damper.

It is important that the surface of the Isokern chimney has a level surface on which to attach the Anchor Plate. If the top of the Isokern does not have a level surface, then it will need to be modified accordingly.

Center the Iso-wool blanket over Isokern Top Plate hole and trace outline of hole with a pen or marker. Cut a hole in the blanket to match the hole in the Isokern top plate. Center the Iso-wool blanket over the Isokern Top Plate flue opening, then center anchor plate over the Iso-wool blanket. If a Damper is used, make sure nothing interferes with the damper plate movement.

Secure the Anchor Plate with four (4) masonry anchors. **(Figure 49)** If the Anchor Plate with Damper is installed the damper should swing freely. When the chain is pulled down, the damper should close (horizontal position). When the chain is released (no weight on the chain), the damper should swing open (vertical position).

To install the lintel hook, place the damper plate in the closed (horizontal) position. Determine and mark the position of the lintel hook. The lintel hook should be mounted in a position so as to provide a small amount of tension in the spring attached to the chain.

The tension is needed to prevent the damper plate from rattling when closed. Mount the lintel hook to masonry with the screws provided. Do not obstruct oval openings in the anchor plate.

WARNING: Do not locate Anchor Plate with Damper in a location inaccessible for inspection, cleaning, and servicing after installation.

2. Attach Chimney: Attach the first section of chimney on the Anchor Plate. The joint assembly is a male to female slip fit and held together with tab lock, twist lock or screwed together. **(Figure 50)**

If installing screws, do not penetrate the inner liner of the chimney with screws. Maintain a 2-inch (2") clearance to combustibles. Do not fill the clearance space with any materials. If an offset is required, refer to Elbow Offset Installation Section.

3. Frame Openings: From the ceiling, drop a plumb bob

Anchor Plate
or Anchor
Plate with Damper

Masonry

Eco-Steel Design Only

FIGURE 50

ECO-STEEL Metal Chimney Installation

FIGURE 5I

to the center of the fireplace's flue outlet and mark the center point on the ceiling. See **TABLE I** below.

Mark appropriate cutting lines around the center point. Cut a square hole in the ceiling. Frame a level, square opening centered over the hole that you have cut. Frame openings at each floor level above the fireplace. **(Figure 49)** These openings are to hold the Firestop and Attic Insulation Shield. Locate each opening by dropping a plumb bob to the four corners of the opening below. Maintain the 2-inch airspace to combustibles.

4. Cut Roof Opening: If penetrating through the roof, determine and cut an opening in the roof directly above the opening below. The cut opening must be 4 inches larger than the chimney's outside diameter to provide at least a 2-inch clearance all around the chimney. The chimney must be centered in this opening.

5. Install Firestop: A Firestop is required on each floor penetration in multistory installations. Building Codes require a Firestop at every floor/ceiling level including where the chimney penetrates the attic. **Figure 5I** shows a typical 2 story installation with an attic.

NOTE: A Firestop is not installed where the chimney penetrates through the roof. The Firestop is installed on the underside of the ceiling/floor framing and secure in place with nails or screws. **(Figure 5I)**

Frame Opening Dimensions

<u>Diameter</u>	<u>Framing Dimensions</u>
16" ID nominal	20" X 20"

TABLE I

ECO-STEEL Metal Chimney Installation

6. Angle Support and Support Band: Install a Support Band if total chimney height is greater than 50 feet, or if the fireplace manufacturer requires it. If additional support is needed, install one or more Supports which will support 30 feet of chimney. **(Figure 53)**

Slide the Support Band around the chimney and align over framed opening. Secure to casing with four (4) sheet metal screws and assemble brackets. **(Figure 52)** Nail the brackets to the framing using a minimum of (2) nails or screws per bracket.

A Support Band may be required by some fireplace manufacturers to keep the chimney vertical and help maintain clearances to combustibles within a chase. Clamp the Support Band to the pipe using the nut and bolt provided and secure legs to nearby framing using plumbers strap or guy wires. **(Figure 55)** The Support Band does not support the weight of the chimney; it is only used to keep the chimney centered within a chase.

FIGURE 52

FIGURE 53

FIGURE 54

FIGURE 55

ECO-STEEL Metal Chimney Installation

7. Attic Insulation Shield: The Attic Insulation Shield must be installed where the chimney passes into an attic. Its purpose is to maintain clearances from loose packed or blown insulation from the chimney. If an Attic Shield is not used the chimney needs to be enclosed within a framed enclosure. Always maintain a 2" air-space clearance to combustibles. Install the shield as follows:

- Remove any insulation or debris from attic floor around the framed opening.
- Assemble chimney sections above the Firestop to a height that extends beyond the height of the attic insulation shield.
- Slip the Attic Insulation Shield over the chimney until the base sits squarely on the framed opening.
- Secure the Attic Insulation Shield to the top of the framed opening using nails or screws. See **Figure 56**

FIGURE 56

8. Elbow Installation: 15° and 30° elbows are provided to allow chimneys to avoid framing members or roof peaks. A maximum of 30° from vertical is allowed and a total of two offsets (4 elbows) for each chimney installation. A 2" clearance to combustibles must be maintained. If more than two (2) offset is needed, a mechanical exhaust fanshould be used. The mechanical fan company would determine the viability of performance.

Attach the elbow to the chimney pipe, support, or other part. Using the offset chart, add chimney sections between elbows. **A Support Band or plumbers strap is required for every 4-foot interval between elbows to support the load. (Figure 57)** Attach the upper elbow to bring the chimney back to vertical. See **TABLE 2** and **(Figure 57)** for offset combinations. 2 offsets (4 elbows) maximum.

TABLE 2

ECO-STEEL Metal Chimney Installation

8. For chase enclosures, install the chase top cover (supplied by others) to the chase enclosure. Cut a hole in the chase top cover the same diameter as the base of the cone on the flashing. Attach the Flashing to the top of the chase cover, sealing with a non-hardening waterproof sealant. Secure in place with screws or rivets. **(Figure 58)**

9. Attach the storm collar around the chimney above the screen of the flashing. Secure in place with the locking tab and button. Seal around the storm collar with a non-hardening waterproof sealant. Attach the Termination Cap to the chimney by sliding the male to female joint connection together and secure in place with four (4) sheet metal screws provided. **(Figure 59)**

10. Termination: NFPA 211, "Standard for Chimneys, Fireplaces, Vents, and Solid Fuel-Burning Appliances", states that chimneys shall extend at least three feet above the highest point where it passes through the roof of a building, and at least two feet higher than any portion of a building within ten feet. **(Figure 60)**

If the horizontal distance from the chimney edge to the peak of the roof is greater than 10', a chimney height reference point is established on the roof surface 10' horizontally from the chimney edge. The top of the chimney (point where exhaust gases exit) must be at least 2' above this reference point. In all cases the chimney must terminate a minimum of 3' above the highest point of the roof opening.

The ten-foot rule is necessary in the interest of safety and does not ensure smoke free operation. Trees, building, adjoining rooflines, adverse wind conditions, etc., may require a taller chimney should a smoking problem exist.

FIGURE 60

Guide for Mechanical Draft System

Mechanical Draft System for Wood and Fired Fireplace with a Single Flue

Application: This is the most common form of installation and is used in all jurisdictions where the 2000 or later edition of the NFPA211 has not yet been adopted.

Sequence of operation:

1. Prepare the wood logs in the fireplace.
2. Turn the Fan Speed Control (FSC) on by turning the knob clockwise. A "click" indicates the control is turned on. Adjust the knob to the desired speed.
3. Start the fire by igniting the logs.
4. Once the fire is fully burning, turn the dial clockwise (to reduce the speed) until there is spillage coming from the fireplace is an indication of spillage. From this point, gradually increase the fan speed by turning the dial counterclockwise until no flue gases spill from the fireplace. This dial can be left in this position.
5. If logs are added to the fire, it may be necessary to increase the fan speed again.
6. When the fire is dying, reduce the speed setting further to remove remaining products of combustion.

IMPORTANT NOTE: Never leave a fire unattended. When a fire is smoldering, it is more likely to emit carbon monoxide. You should always have a smoke detector and a carbon monoxide detector installed in the same room where the solid fuel burning appliance is installed.

The EcoDamper System quietly manages a perfect draft and prevents conditioned air from escaping through the chimney when the fireplace is not in use. It eliminates the need for glass doors, opening up many new design options while allowing for a larger view area of the fire and a more natural look.

The system consists of the RSHT Chimney Fan, the Manual Fireplace Damper (MFD), and Fan Speed Control.

RSHT Chimney Fan

The RSHT Chimney Fan is a high temperature fan used to maintain the proper draft in a solid fuel chimney or stack system. It is intended for wood burning fireplaces. It boasts a 1000°F temperature rating. The FSC variable Fan Speed Control comes standard with the fan.

Manual Fireplace Damper

The MFD-S Fireplace Damper for solid fuel prevents conditioned air from escaping through the chimney when the fireplace is not in use and prevents backdraft down the chimney. It includes an easy-open pull cable and handle that is mounted inside the fireplace.

Fan Speed Control

The FCS Fan Speed Control is used in conjunction with all single-phased chimney fans. It is specially engineered to provide variable speed control of split capacitor motors.

NOTES:

- 1 THE DISCONNECT MEANS AND CIRCUIT PROTECTION ARE TO BE PROVIDED BY THE INSTALLER OF THIS DEVICE

— 24 VAC
— 120 VAC

Note: The diagram is for reference only. Job specific wiring diagrams can be provided by ENERVEX.

Component	Part#	Description
	RSHT	1600 RPM High Temperature Chimney Fan
	MFD-S	Manual Fireplace Damper
	FSC	Fan Speed Control (included with Chimney Fan)

Access Modification - Combustion Air Kits, Gas & Electrical Line Feed

A four inch(4") supplemental combustion air inlet kit may help improve fireplace operation in homes tightly sealed and with other ventilating appliances installed (Figures 61 & 62). The following is a general representation of a combustion air kit.

FIGURE 61

CAUTION:

All access holes must be properly sealed after firebrick installation

FIGURE 62

FIGURE 63

The air kit is fitted into the front 1/3 of the side wall of the firebox by core drilling an appropriately sized hole at the selected firebox location. Keep the top of the access hole no more than six inches (6") above the finished firebrick floor. The hole size should allow for a quarter inch (1/4") joint around the air access sleeve for heat expansion. Do not install in the rear of the firebox. Combustion air kits must be installed in accordance with local codes.

Fireplace Make Up Air Requirements

Standard Series

Model #	Consumption Air Flow (CFM)
80S36	363
80S42	424
80S46	464

WARNING: Do not use combustible duct material. Avoid installing a combustion air inlet where the opening could be blocked by snow, bushes, or other obstacles. Air inlet ducts shall not terminate in attic, basement, or garage spaces.

Gas Line Feed

For a fireplace having the provision for installation of a gas pipe, the provision is intended only for connection to a decorative gas appliance.

CAUTION: When using the decorative appliance, the fireplace damper must be set in the fully open position. Gas line for gas log sets used in the Isokern firebox can be routed through the side wall, by drilling an appropriately sized hole using a masonry drill bit. (Figure 63)

Electrical Line Feed

can be routed through the MAGNUM firebox side walls by drilling an appropriately sized hole using a masonry drill bit (Figure 63). Be sure to follow the gas log Appliance Manufacturer's explicit electrical line connection instructions for vented masonry fireplace installations. Gas line and electric line must be fed through separate access holes.

CAUTION: All access holes must be grouted with mortar – after line or conduit feed - to seal any gaps or cracks around line feed conduits. (Figure 63)

Firebrick Installation

The manufacturer requires for the 36, 42 and 46 model fireboxes be lined with a minimum (1 1/8") thick firebrick. Thicker firebrick may be used as an option. The pattern for the firebrick lining is an owner option. The ISOSET mortar by Earthcore is to be used when lining the Isokern Fireplace.

The ISOSET Firebrick Mortar Application:

- Add .75 quarts of water per 10 lbs. of dry product until completely blended.
- Only mix what can be utilized within 15 minutes
- Do not retemper (the addition of water after the chemical reaction has begun).
- The use of warm water will accelerate setup
- Joint thickness should be thin (1/4" - 3/8")
- Complete set time is between 48 & 72 hours.
- For best results, please allow 28 days before heat is applied.
- Approximately 35 to 40 lbs. of prepared mortar will lay up one hundred 9" x 4 1/2" x 2 1/2" Straights.
- **DO NOT add additives such as fireclay, sand, cement, or other accelerators.**

These instructions may vary because of different climates and conditions. The use of good masonry practices for your area should also be considered.

Installation Instructions:

1. Wet mop the inside of the fireplace with a damp sponge to remove dust and loose particles from the interior before installing firebrick. Keep the fireplace damp while installing firebrick.

For Best Results:

1. After wetting interior of firebox apply a 1/4 notch bed joint on rear sides and floor.
2. Dip each firebrick in a pail of water before applying mortar to one side for adherence to firebox.

2. Face joint dimension of 1/4" - 3/8" in the brick work is recommended and has the best appearance. Other face joint dimensions are acceptable however smaller joints may not leave room for heat expansion of firebrick.

3. Start the firebrick at the front edge of the floor of the Isokern firebox, proceeding inward toward the back. Let the floor brick gap approximately 1/2" off the back wall and side walls. This air space allows heat expansion of the firebrick and is to be left empty of mortar. (Figure 64)

4. Next, apply firebrick to the back wall of the unit. The back wall firebrick covers the 1/2" expansion gap left at the brick floor along the back wall of the firebox. (Figure 65)

5. Set the side wall firebrick by starting at the front edge of the unit's side wall and working inward toward the back wall firebrick. The side wall firebrick, when completed, covers the 1/2" expansion gaps where both the floor firebrick and the back wall firebrick were held off the unit's side walls. (Figure 66)

All required through-wall accesses (gas and air intake supply access holes) should be drilled before the required firebrick lining is installed. Do not cover these areas with firebrick.

Earthcore makes no claims as to the performance of firebrick or firebrick mortar(s). It is typical for heat stress cracks to appear in the firebrick in fireplaces.

The expansion joint in this illustration is on the hearth.

FIGURE 64

FIGURE 65

The expansion joint in this illustration is on the backwall.

FIGURE 66

Flush Wall Finish Detail

When drywall is the wall finish at the STANDARD face and flush with the rough face of the STANDARD firebox and damper beam, it is recommended when installing the required firebrick lining to the interior of the firebox, that the leading edge of the firebrick - at the floor and at the side walls of the firebox - be set flush with the STANDARD's rough firebox front. This will aid in the overall fit and finish of the STANDARD Series fireplace front when the code required non-combustible finished facings are applied.

This alignment of firebrick application, as shown below (**Figure 67**), allows the firebrick lining to be in the same plane with the room's wall finish surface. With the firebrick set in this fashion the non-combustible finish facing material can be set tight against the leading edge (or "room edge") of the firebrick at the sides of the fireplace opening. At the same time the finished facing material can lay flat against the room's finished wall surface.

FIGURE 67

Clearance to Combustible Trim - 36, 42 & 46 Models

Hearth Extensions

All STANDARD 36, 42 and 46 Fireplaces shall have hearth extensions of brick, concrete, stone, tile, or other code approved noncombustible material. Suitable hearth extension material for the fireplaces shall be placed on the hearth extension's noncombustible substrate and must extend to at least twenty inches (20") in front of the fireplace's finished opening and must extend to at least twelve inches (12") beyond the sides of the finished fireplace opening. **(Figure 68)**

WARNING: The noncombustible hearth extension, by code, must sit on noncombustible substrate which shall have no wood underpinnings.

This means that off-grade wood floor systems shall be constructed in such a way that all wood floor joists, and sub-flooring shall stop twenty inches (20") out from the front of the firebox. **(Figure 69)**

Mantle and Mantle Shelf Clearances

Fireplaces are subject to the same building code safety clearances to combustible trim as with any radiant heat fireplace.

All combustible trim shall be kept at least eight inches (8") from the finished fireplace opening.

Combustible trim located along the sides of the fireplace opening, which project more than one and one-half inches (1 1/2") from the face of the fireplace, shall have additional clearance from the eight inches (8") equal to the projection.

Combustible projecting mantles - up to twelve inches (12") of projection - shall not be placed less than fourteen inches (14") from the top of the fireplace opening. Combustible mantles which project more than twelve inches (12") from the face of the fireplace, shall have additional clearance from the fourteen inches (14") equal to the projection.

Note: The local authority having jurisdiction may require greater clearances for projecting combustible mantle shelves. Be sure to check local building codes regarding required clearances to projecting combustible mantles.

Adjoining Walls. Side walls and walls to rooms adjoining fireplace installations cannot be closer than twenty-six inches (26") to the finished fireplace opening.

Note: "Clearance to Combustible Trim" are those distances required to ensure that a fireplace mantle or facing will not catch fire. In most cases the distances should also be adequate to prevent any discoloration or warping due to heat. However, each installation presents a unique and completely different set of circumstances involving many variables.

These include paint or finish composition, previous exposure to heat, methods and quality of construction, air flow patterns, etc. Because of these variables, the manufacturer does not guarantee that heat warping or discoloration will never occur.

FIGURE 68

FIGURE 69

Specialty Applications - Outdoor Installation

The Isokern fireplace can be used in an outdoor application and is considered an "Outdoor Application" if the fireplace is a freestanding unit, located a minimum of ten feet (10') away from any structure. These structures would include your house, patio cover, detached garage or any other standing structure. **(Figure 70)**

Selecting an Outdoor Location

To determine the safest and most efficient location for the fireplace, you must take into consideration the following guidelines:

1. The location must allow for proper clearances and venting.
2. Consider a location where the fireplace will not be affected by down drafts, impending structures, or frequently opened doors.
3. Avoid a location where the chimney termination will be near abrupt changes in the roof shape, nearby wall, under trees or above the roof of a single-story wing of a two-story building.

Chimney Flue

A recommended minimum height of chimney, measured from base plate of the fireplace to flue gas outlet of termination, should be 9.5 feet. If the fireplace is located adjacent to structures on the property, the chimney height should be a minimum of two feet taller than that structure. The height of the chimney will require calculated dimensions to make sure the smoke vents properly upward through the chimney and doesn't create a downdraft that will push the smoke back out of the hearth.

The use of either the DM 54 or ECO-STEEL & ECO-STEEL + Chimney flue are the recommended flue types for the STANDARD models in the outdoor application. If the use of ECO-STEEL & ECO-STEEL + Chimney is used a 2" clearance to combustible material is required. See page 40 for more information.

Supporting Footers

It must be built upon a concrete support slab with no wood underpinnings. In the outdoor application careful load calculations should be made for the veneer type used on the fireplace as well as the chimney weight.

Foundations and footings must be made of a frost -protected foundation and be approved by the local building authority. For any foundation design and load requirements check with local structural engineer. **It is the responsibility of the General Contractor to insure adequate foundations.** See page 14 for weight calculations.

IMPORTANT: Due to heat and weight issues, the Isokern fireplace and DM 54 chimney system installations require that the system be built upon a non-combustible concrete slab with no wood underpinnings supported to footings with concrete or steel and designed to carry the total weight of the Isokern fireplace and chimney system.

Assembly Instructions

Refer to the assembly instructions that are found on pages 21 - 25.

NOTE: A damper is not required in an outdoor application of the Isokern Fireplace.

Clearance to Combustibles

Follow the instructions on page 51 on the Required Clearances to Combustibles.

FIGURE 70

Specialty Applications - Two Story Stacked Installations

General Information

To install one Fireplace and DM chimney system above one another, as in a two-story stacked installation, both the upper and lower fireplace installations require a structurally designed support down to footings designed by a structural engineer.

Frequently in two story stacked installations the lower unit is supported by a slab-on-grade, whereas the upper unit is a typical off-grade support. The off-grade slab for the upper unit must be built with sufficient width to accommodate the width of the upper fireplace plus the width of the by-passing chimney system rising from the lower unit. **(Figure 71)**

The slab for the lower unit will need to be built with enough width to provide support for the lower fireplace unit plus the bearing surface for the support columns needed to carry the offset chimney sequence of the lower system. **(Figure 71)**

Floor-to-Floor Height Considerations

In order for the lower fireplace installation to have enough overhead height clearance for its chimney to rise at a thirty-degree (30°) angle of offset (maximum angle of offset as allowed by code) and bypass to one side of the firebox in the upper location there are minimum required floor-to-floor height dimensions. (See chart, page 71 Dimension "F")

The minimum floor-to-floor height required for an installation is determined by calculating the total horizontal distance the lower flue must travel to the left or right for it to bypass to one side of the upper fireplace. (see calculating offsets on pages 30 - 32)

The total amount of horizontal chimney offset travel distance will be determined by two factors:

1. The width dimension of the upper unit; and
2. The horizontal distance between centerlines of the proposed upper and lower units.

Example: If the upper fireplace and the lower fireplace sit on the same centerline then the required floor-to-floor dimension is at a maximum (See Figure 72 and chart on page 54, column "F")

For every 3" of horizontal distance separating the centerlines of the upper and lower units the overall height of the offset sequence is reduced by one offset block or by 6".

FIGURE 71

Specialty Applications - Two Story Stacked Installations

The following chart gives important dimensions needed when laying out two story stacked fireplace units. Chart dimensions assume that both the upper and lower fireplace units sit on the same centerline.

NOTE: Widths of both Isokern Standard fireplaces are the same. Only the depth of the firebox and the height of the finished opening differ.

Fireplace Size						
Upper/Lower	A	B	C	D	E	F
36/36	43"	51"	30"	81"	70"	142"
36/42	43"	51"	33"	84"	70"	142"
36/48	43"	51"	35"	86"	70"	142"
42/36	49"	54"	33"	87"	70"	148"
42/42	49"	54"	33"	87"	70"	148"
42/48	49"	54"	35"	89"	70"	148"
48/36	53"	56"	35"	91"	70"	149"
48/42	53"	56"	35"	91"	70"	149"
48/48	53"	56"	35"	91"	70"	149"

Chart Dimension Description

A: is the outside width dimension of the Fireplace model chosen for the upper unit.

B: dimension represents distance (taken in the direction of the chimney offset) from the centerline of the lower fireplace to the outside face of the eight inch (8") thick bearing wall underpinning the upper unit's floor system.

C: dimension is the distance (taken away from the direction of the chimney offset) from the centerline of the lower or the upper fireplace, whichever is the larger plus eight inches (8") to the outside of the eight inch (8") thick bearing wall for the upper unit's support slab.

D: is the outside-to-outside dimension of the two eight inch (8") thick bearing walls underpinning the upper unit's support slab. "D" is also the width of the upper unit's support slab and includes the additional space for the width of the DM chimney as it bypasses the upper unit. "D" is also the sum of "B" plus "C".

E: is the height of the Fireplaces chosen for the lower unit and includes the Isokern three-inch-thick base plate.

F: is the dimension from the top of the support slab of the lower unit to the top of the floor of the upper unit.

IMPORTANT: If raised hearths are planned for the lower unit then "F" dimension will increase by the height of the raised hearth at the lower unit.

FIGURE 72

Specialty Applications - Custom Cut See-Thru Application

See-Thru or two-sided STANDARD fireplaces can be custom ordered through your Isokern representative. The following directions are to demonstrate how to place the steel angle iron on the front and back of the sidewalls or backwalls before the damper beams are set and the smoke dome is constructed. **When installing a See-Thru Application Fireplace, a Mechanical Exhaust Fan is highly recommended.**

NOTE: Two pieces of steel angle iron four inch by four inch by three-eighths inch (4"x 4" x 3/8") cut to span the firebox openings should be set on top of the side wall assembly on both sides before the damper beams and smoke dome assembly.

Notch the ends of each new sidewall or backwalls thickness of the steel as shown. Each end of the steel angles must bear fully at least 3" onto the side wall assembly.

Since there is no back wall assembly and no side wall ledge for placement of a cast iron throat damper, the smoke dome for the See-Thru fireplace is built by placing one long damper beam on top of the firebox back wall and flush with it; the other long damper beam sits 23/4" back from one side of the Isokern STANDARD firebox, spanning the firebox opening.

Once the smoke dome assembly is built and the DM chimney or Eco-Steel/Eco-Steel+ Chimney Flue is installed, a chimney top damper Part #MMR is set at the top of the flue, or a bottom mount damper is installed to the inside of the top plate.

Seismic Requirements (Slab On Grade)

PROCEDURE

1. Drill hole of proper diameter and depth using a carbide tipped drill or coring bit. Avoid any existing reinforcing steel by relocating hole slightly.
2. Clean hole thoroughly by vacuum or air pressure.
3. Make sure that hole is dry and clean before grouting.
4. Place epoxy grout in hole with caulking gun or similar equipment starting at bottom, fill hole approximately 2/3 full.
5. Coat dowel with same epoxy grout and insert into hole, forcing material around the sides of the bar and completely filling all voids.
6. Provide support for dowel by tying to rebar or other element until grout has cured.
7. Epoxy grout in CMU shall be simpson set epoxy tie (ESR-1772), HILTI HIT-HY 150 max (ESR-1967), or equal.
8. Epoxy grout in concrete shall be HIT-RE 500-SD by Hilti corporation. (ESR-2322), simpson set-xp (ESR-2508) or equal.
9. Special inspection required.

Summary

1. Chimney Installation and Draft

Chimney systems will only draft properly when they are installed according to the instructions, in an appropriate location and with the proper chimney height. Installing the fireplace according to the instructions, choosing an appropriate location, and choosing an appropriate chimney height are the responsibility of the designer and the building contractor.

Tightly insulated and sealed homes, two story interior spaces and high vaulted ceilings can cause negative air pressures within the house which can impair drafting performance. HVAC return air ducts near the fireplace opening will adversely affect the fireplace drafting performance.

It is the responsibility of the designer, the building contractor, and their mechanical contractor to determine that the building's internal air pressures are conducive to positive fireplace drafting.

Avoid placing any fireplace in an area near tall trees, tall buildings, or high land masses. These structures can reduce ambient air flow pressure as well as produce down drafts, either of which can impair fireplace drafting performance.

Earthcore Industries L.L.C. does not warrant drafting and is not responsible for it.

2. Fireplace Curing Instructions

It is critical that the Isokern masonry elements in the firebox and smoke dome assembly be dry before firing of the unit. Moisture left in the components from exposure during storage and shipping, as well as moisture from the installation phase, must be eliminated before the unit is put to its intended use.

The first step in reducing the ambient moisture is to be sure that the completed fireplace rest totally in a dried-in setting for a minimum of 28 days after construction of the unit is complete.

The next step in curing the fireplace is to be sure that the first five or six fires are of short duration.

The first fire of the unit can take place once the minimum twenty-eight day drying period has passed. This fire should be especially short.

Start the first fire slowly with a small amount of paper and kindling (small dry wood splits or twigs) and a maximum load of four to six pounds of dry firewood, estimated to be no more than two or three logs each of about three inches (3") to four inches (4") diameter.

The first fire should burn for no more than thirty to sixty minutes and then allowed to go out. Do not refuel the fireplace during the first lighting.

A cooling off period of twenty-four hours, at a minimum, should follow the first fire.

The second fire should be the same as the first fire. It should burn for no more than thirty to sixty minutes and allowed to go out. Do not refuel the fireplace during the second lighting.

A twenty-four-hour cooling off period must be observed following second lighting.

After first and second fire, continue use of the unit with three or four small fires of short duration (sixty minutes or so) and small fuel load.

After these first five or six small fires of short duration normal use of the fireplace can proceed. For normal use the maximum recommended fuel load is twelve to sixteen pounds of dry firewood at a time. This fuel load is considered to be approximately three to five cured hardwood logs of about three inches (3") to six inches (6") in diameter. As the fire burns down, refueling should be only one or two logs added at a time.

IMPORTANT: Do not burn construction debris or trash of any kind in the fireplace. Whereas it is not uncommon for construction debris and refuse to be burned in a fireplace by site personnel on a project that is under construction, this activity must be avoided. It is the responsibility of the building contractor to ensure that the required dry-in period is met and that the required lighting sequence is performed by the owner or by the owner's agent.

3. Log Grates

Log grates are required for burning solid fuel in the Isokern fireplace. Grates allow for easy air flow up through the burning logs thus creating a more complete and efficient burning of the fuel.

4. How to Build a Fire

First set the fireplace damper in the fully open position. Begin laying the fire by placing several pieces of wadded up paper directly on the log grate. Place kindling (small splits of dry pine or other dry softwood) on top of the paper, enough to loosely cover the paper. Next arrange several small, dry hardwood or softwood logs or log splits on top of the kindling layer.

Finally, arrange two or three larger hardwood logs (oak, hickory, etc.) or log splits on top of the stack. Ignite the paper at the bottom of the stack. The burning paper will ignite the kindling which will, in turn, set the remaining fuel on fire.

Be sure to stack all firewood in such a way that it will settle into the log grate as the paper and kindling layers are burned away. Additional logs can be set onto the fire as each fueling burns down.

Ideally, fuel logs should be of a hardwood species that have been air dried for one year or longer. Use of cured or uncured pine logs and uncured hardwood logs for fuel should be avoided. Pine logs and uncured hardwood logs will tend to smolder and burn at relatively low temperatures producing high levels of soot and creosote.

IMPORTANT: Do not throw, toss, jam, kick or otherwise force logs into the Isokern fireplace.

Summary

Glass Doors: We recommend one 4-inch diameter outside air kit for the STANDARD 36, 42 and 46 models. All glass must be a minimum of 3/16" in thickness and shall be of tempered or ceramic glass as supplied by our approved vendors. **DOORS MUST BE KEPT IN THE OPEN POSITION WHEN FIREPLACE IS IN USE.**

WARNING: Never use gasoline, gasoline type lantern fuel, kerosene, charcoal lighter fluid or other similar liquids to start or "freshen up" the fire in this fireplace or in any fireplace.

WARNING: If processed solid fuel fire logs are used: Do not poke or stir the logs while they are burning. Use only fire logs that have been evaluated for the application in fireplace and refer to fire log warnings and caution markings on packaging prior to use.

5. Avoid Over-firing this Fireplace

Some examples of over-firing are:

- Burning of scrap lumber, construction debris, pine branches and brush or cardboard boxes;
- Burning small diameter twigs, branches or any other small sized combustible materials in quantities which exceed the volume of the normal log fire;
- Use of artificial wax base logs, trash or other chemicals or chemically treated combustibles.

WARNING: Over-firing can permanently damage this fireplace system.

6. Fireplace Doors and Screens

The following door manufacturers are approved for installation and use on all Isokern gas fireplaces. We recommend an outside air kit be installed into the fireplace with a minimum duct size of 4" to provide adequate make up air supply. See page 48 for Outside Air Kit guidelines. All glass must be a minimum of 3/16" in thickness and shall be of tempered or ceramic glass as supplied by our approved vendors. **DOORS MUST BE KEPT IN THE OPEN POSITION WHEN FIREPLACE IS IN USE.**

Abbeville, SC 29620
800-421-0771

7. Disposal of Ashes

It is recommended that the firebox be cleaned of excessive ashes before each use. It is necessary to remove ashes from the open front of the fireplace. To do so, proceed in the following manner:

Allow the fire to go out and the ashes to cool for at least six to eight hours.

After the cooling period carefully pick up the ashes from the firebox with a small, metal fireplace shovel or other metal scoop and place them in a metal container with a tight-fitting lid.

If possible do not sweep the ashes as this will stir them into the air and disperse them into the room.

The closed container of ashes should be placed on a non-combustible floor or on the ground, well away from all combustible materials, pending final disposal. If the ashes are disposed of by burial in soil or otherwise locally dispersed, they should be retained in the closed container until all cinders have thoroughly cooled.

8. Gas Log Sets

If you install a vented gas log set (decorative gas appliance), the log set must comply with the Standard for Decorative Gas Appliance for Installation in Solid Fuel Burning Fireplaces, ANSI Z21.60 or Z21.84 and shall also be installed in accordance with the National Fuel Gas Code, ANSI Z223NFPA 54 latest edition.

If you wish to install an unvented (vent-free) gas log set, only unvented gas log sets which have been found to comply with the standard for unvented room heaters, ANSI Z21.11.2 are to be installed in this fireplace. Check local codes for compliance for unvented (vent free) gas log sets.

WARNING: Do not operate a vented gas log set in this fireplace with the chimney removed.

9. Log Lighter

If a log lighter is installed, it should be installed on the front of the grate in such a manner to minimize flame impingement, the amount of heat exposure and that logs placed on the grate will not rest directly on the log lighter tube. Also, the floor clearance should be sufficient to minimize the chance of the blockage of the burner ports by ash accumulation.

Installation of the log lighter should follow all local codes or, in the absence of local codes, to the National Fuel Gas Code, ANSI Z 223. 1NFPA 54.

Refer to log lighter manufacturer for installation instructions, clearances, and any information specific to that log lighter system.

10. Inspection and Cleaning

At least twice a year in warm climates or monthly during the heating season in colder climates, thoroughly

Summary

inspect the fireplace and chimney system. Chimneys must be installed so that access is provided for inspection and cleaning. The chimney should be inspected monthly during the heating season.

Inspect the entire flue from the top down for obstructions such as birds' nests, leaves, etc. Such obstructions must be removed.

Check spark arrestor screens for clear flow of smoke every two to four weeks during the heating season.

Inspect the flue periodically during the heating season for the presence of soot and creosote buildup. If creosote or soot has accumulated, it should be removed to reduce the risk of chimney fire.

Have your chimney cleaned and inspected by a professional chimney sweep annually.

WARNING: Do not use chemical fireplace and chimney cleaners that are poured on a hot fire. These can be dangerous and generally work only on the flue section nearest the fire, leaving the rest of the flue unaffected.

II. Exterior Maintenance

Annually, at a minimum, check all metal flashings and weather seals around the exterior chimney where it penetrates the roof surface; inspect any chimney top spark arrestors, metal cowlings and weather hoods to make sure they are secure and weather tight.

Seal any cracks or gaps in chimney-to-roof flashings to prevent possible roof and chimney chase leaks.

Inspect any cement chimney cap or clay chimney pot terminations to make sure they are not diverting water into the structure. Seal any suspected cracks or gaps in these masonry components.

Warranty & Disclaimer

Isokern STANDARD Series Fireplace

Earthcore offers a lifetime warranty for all Isokern components, to be free from defects in materials that negatively affect system performance from the date of purchase, subject to the terms and conditions of this limited warranty.

This warranty covers only the above stated components, and NO WARRANTY, EXPRESS OR IMPLIED, EXTENDS TO ANY OF THE HARDWARE, FOOTING, VENTS, DUCTING, metal flues, FIREBRICK OR ACCESSORIES. THIS WARRANTY DOES NOT COVER DRAFTING, SMOKING OR PUFFING OF THE FIREPLACE SYSTEM. Factors beyond the manufacturer's control affect fireplace drafting, smoking, and puffing, and ISOKERN cannot guarantee these aspects of performance.

If a component is found to be defective under the terms of this warranty the party to whom this warranty is extended shall, notify ISOKERN, 6899 Philips Industrial Blvd, Jacksonville, Florida 32256, in writing, by registered mail, within thirty (30) days following the discovery of the defect within the lifetime warranty period. The notice shall contain (1) the date of purchase; (2) place of purchase; (3) address of installation; (4) name, address, and phone number of the owner; and (5) abrief description of the defect.

Earthcore, or any division thereof, is not responsible for any labor costs or indirect costs incurred for the replacement of defective components.

Earthcore is not responsible for misuse or mishandling of components. Nothing in this warranty makes Earthcore, or any division thereof, liable in any respect for any injury or damage to the building or structure in which the fireplace or chimney system has been installed or to persons or property therein arising out of the use, misuse, or installation of properly manufactured ISOKERN product.

EARTHCORE, OR ANY DIVISION THEREOF, SHALL NOT BE HELD LIABLE FOR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES OR EXPENSES ARISING FROM USE OF THE FIREPLACES OR CHIMNEY SYSTEMS. ALL SUCH DAMAGES AND EXPENSES ARE HEREBY EXCLUDED.

This warranty is null and void when the fireplace or chimney systems are not installed pursuant to the installation instructions provided by Earthcore or local building codes have not been followed completely.

This warranty applies only to those fireplace and chimney systems installed in the continental United States, Alaska, and Canada. If any part of this warranty is found to be unenforceable, the remaining parts shall remain in force and effect.

EARTHCORE HEREBY DISCLAIMS ALL GUARANTEES AND WARRANTIES, EXPRESS OR IMPLIED, BEYOND THE WARRANTIES SET FORTH HEREIN.
