82X96	112"	71"	29-1/2"
82X120	135"	71"	29-1/2"

**NOTES:**

- "B" includes the required 3" thick base plate.
- Rough framing dimension for Height "B" will need to be increased by height of Isokern #133 or 8" CMU Block if they are used.
- If the XCELUX installation is to be elevated, this "Raised hearth" installation will require additional rough opening height at "B" that is equal to the height of the raised hearth.
- Rough framing dimension for depth "C" allows for the required 1-1/2" clearance at the back of the fireplace. Note that this 29-1/2" is typically used on interior walls that do not have insulation present.

**IMPORTANT:** Unless the insulation on an exterior wall is installed behind plywood sheathing, a depth of 31" is often used to account for the required 3" clearance to insulation. Even with this increased distance, the installer should be aware that spray foam insulation may expand past the face of the stud wall and will require trimming prior to firebox installation to maintain the required 3" clearance. It is important that any insulation that is not installed behind sheathing shall be installed in such a manner that it cannot fall on the firebox and encroach on this clearance.

**Firebrick Installation - XCELUX Fireplace**

- Start the "Split" firebrick at the front edge of the floor of the Isokern firebox, proceeding inward toward the back. Let the floor brick gap approximately 1/2" off the back wall and side walls. This air space allows heat expansion of the firebrick and is to be left empty of mortar.
- Starting approximately 1/2" from the rear of the firebox, lay one course of "Full" sized firebrick on top of "Split" firebrick floor. Ensure a gap of approximately 1/2" is kept between firebrick and sidewall to allow for expansion.
- Lay two courses of "Full" sized firebrick so that the leading edge of the coursing is aligned with opening of the firebox. Ensure a gap of approximately 1/2" is kept between firebrick and sidewall to allow for expansion.
- Apply "Split" firebrick to the rear wall of the unit. Ensure approximately 1/2" gap is kept between firebrick and sidewall, as well as an 1/4" gap is kept between firebrick and damper beam assembly to allow for expansion.
- Starting at the front edge of the unit's sidewall, apply "Split" firebrick to the side wall of the unit. Ensure approximately 1/2" gap is kept between firebrick and damper beam/damper block assembly to allow for expansion.
- Repeat on opposite side wall.

**IMPORTANT:** Ensure that the required holes for the Isoflames XL Burner's 3/4" gas supply line and pilot assembly gas and electrical connections are drilled prior to firebrick installation. **DO NOT COVER THESE AREAS WITH FIREBRICK!**

**NOTE:** Gas and electrical connections may be brought through the rear wall of the unit and into the area of the firebrick cavity. A gap will need to be left in the firebrick extending from the cavity to the rear wall of the unit for passage of the 3/4" gas line, pilot tube, and electrical connections. Ensure all holes are filled with mortar after installation.

**Flooring System**

**NONCOMBUSTIBLE FLOORS**

XCELUX Fireplaces must be built upon a concrete support slab with no wood underpinnings. Proper reinforced concrete support slab for fireplace installations may include the following types:

- Slab on grade: standard residential, minimum four inch (4") thick, 2500 psi concrete foundation on properly compacted fill.
- Off-grade slab on foundation walls and footings: Projects with off-grade floor systems as well as upper-story installations require this type of support. When building off-grade support slabs the code required hearth extension substrate should be built as a continuation of the support slab for the fireplace unit. Supports for off-grade slabs must be concrete or steel and capable of supporting the slab, Isokern unit, and the chimney.

**NOTE:** For multi-floor and back-to-back installations proper weight computation on an individual basis is required. Consult a local structural engineer for load bearing requirements.

**IMPORTANT:** Foundations and footings must meet local code and be approved by the local building authority. For any foundation design and load requirements check with a local structural engineer. It is the responsibility of the General Contractor to ensure adequate foundations.

For a raised hearth (floor of the firebox elevated above the room's noncombustible floor), the XCELUX base plate can be set on a Isokern #133, CMU Block, or poured concrete platform that is built up to the desired raised hearth height on the concrete support slab. When calculating raised hearth height, be sure to allow for the three inch (3") thick base plate plus the one and one-half inch (1-1/2") thick fire brick floor in addition to the height of the concrete block platform. CMU used for base plate support should be rated ASTM 90.

**COMBUSTIBLE FLOORS**

For installation on combustible floor, 5" thick Isokern material (Part #133) or alternatively 8" CMU block may be used to create the required clearance to combustible between the firebox and combustible floor system. See Table 1 and 2 for block layout pattern and spacing.

**Recessed Application on Combustible Floor System**

If the design preference is for a flush hearth installation of the XCELUX Fireplace (floor of the fireplace at the same level the room's floor), the Isokern #133 or 8" CMU block can be lowered to the recessed floor system with advanced planning. When calculating depth of recess required for a flush hearth, be sure to account for the assembled thickness of the Isokern 133 or 8" CMU block.

**IMPORTANT:** Whether a flush hearth is preferred or a raised hearth, the XCELUX Fireplace requires that the combustible floor in front of the fireplace must be covered with a noncombustible hearth extension set tight against the fireplace front and extend at least 20" out from the finished fireplace and at least 12" beyond the finished sides of the fireplace opening.

**NOTE:** Field verified dimensions should make allowance for hearth extensions in front (20") and sides (12" ea.) from the fireplace opening. Also, make sure fireplace sides and rear have minimum 1-1/2" clearance to combustibles.

**IMPORTANT:** The level of the finished firebrick hearth floor and noncombustible hearth extension shall not be recessed below the level of the finished floor.

**Clearance to Combustible Trim**

**NOTE:** "Clearance to Combustible Trim" are those distances required to ensure that a fireplace mantel or facing will not catch fire. In most cases the distances should also be adequate to prevent any discoloration or warping due to heat. However, each installation presents a unique and completely different set of circumstances involving many variables.

These variables include paint or finish composition, previous exposure to heat, methods and quality of construction, air flow patterns, etc. Because of these variables, the manufacturer does not guarantee that heat warping, or discoloration will never occur.

**MANTEL AND MANTEL SHELF CLEARANCES:**  
XCELUX units are designed to be installed so that the rough front face(s) of the Isokern firebox and smoke dome sit flush with the face of the rough framing members that create the room wall finish.

All combustible trim projecting less than one-and-one-half inch (1-1/2") from this plane must be kept a minimum of eight inches (8") from the sides/top of the firebox openings.

All combustible trim projecting more than one and one-half inch (1-1/2") must be kept a minimum of twelve inches (12") from the fireplace opening.

Parts of the combustible mantel assembly located along the sides of the fireplace opening, which project more than one-and-one-half inches (1-1/2") from the face of the fireplace, shall have additional clearance equal to that of the projection.

Parts of the combustible mantel assembly located above and projecting more than one- and one-half inches (1- 1/2") from the fireplace opening shall not be placed less than twelve inches (12") from the top of the fireplace opening

**ADJOINING WALLS:**  
Side walls and walls to rooms adjoining the Isokern fireplace installation cannot be closer than twenty-four inches (24") to the finished fireplace opening.

**CEILINGS:**  
The minimum clearance from the top of the fireplace opening to a ceiling is forty-two inches (42").

**Weights and Load Calculations**

For framing for XCELUX installation will need to be designed and built to accept substantial dead loads spread over a relatively small floor area. The following weights and sizes can be used to calculate loading. It is the contractor's responsibility to provide adequate floor system load capacity.

**WEIGHTS AND LOAD CALCULATIONS** Total dead load amounts include (but are not necessarily limited to) the following items and their corresponding weight estimates as listed below:

- Isokern unit weights:
  - XCELUX— 48: 1,645 lbs. (no burner, flue, or accessories)
  - XCELUX— 60: 2,115 lbs. (includes steel angle, but no burner, flue, or accessories)
  - XCELUX— 72: 2,420 lbs. (includes steel angle; but no burner, flue, or accessories)
  - XCELUX— 96: 3,000 lbs. (includes steel angle; but no burner, flue, or accessories)
  - XCELUX— 120: 3,550 lbs. (includes steel angle; but no burner, flue, or accessories)
- Approximate weight of glass media: 100 lbs.
- Fire brick and Adhesive: 350 lbs.- 2000 lbs. depending on brick size and pattern
- Facing material: per general contractor
- B-Vent metal flue: per manufacturer and installation requirements

**NOTE: Raised hearth applications with Isokern Support Blocks or CMU Blocks increases dead load weight**

The floor area for each model is as follows:

- XCELUX — 48: @ 53" x 28" = 10.3 sq. ft.
- XCELUX — 60: @ 73 x 1/2" x 28" = 14.3 sq. ft.
- XCELUX - 72: @ 85 x 3/4" x 28" = 16.67 sq. ft.
- XCELUX — 96: @ 108 x 1/4" x 28" = 21.04 sq. ft.
- XCELUX — 120: @ 131 x 3/4" x 28" = 25.62 sq. ft.
